Code Check® Mechanical Fourth Edition

By DOUGLAS HANSEN & REDWOOD KARDON
Illustrations & Layout by Paddy Morrissey

© 2012 Code Check LLC. The information contained in this document is believed to be accurate; however, it is provided for informational purposes only and is not intended as a substitute for the full text of the referenced codes. Publication by Taunton Press, ICC, and the authors should not be considered by the user to be a substitute for the advice of a registered design professional.

Code Check Mechanical 4th edition is an illustrated guide to common code questions in residential heating, ventilation & air conditioning systems.

The primary code used in this book is the 2009 edition of the *International Residential Code for One- & Two-Family Dwellings*, published by the International Code Council (ICC). It is the most widely used residential code in the United States. The other major code referenced here is the *2009 Uniform Mechanical Code*, published by the International Association of Plumbing & Mechanical Officials (IAPMO). For most topics, these different codes are in agreement. These codes also reference standards maintained by the organizations in Table 2 (T2).

Additional codes for specialized items are listed in T1. The National Fire Protection Association (NFPA) publishes several of these. The 2009 cycle of codes is likely to remain in effect in most areas for at least 4 or 5 years after the cover date. Energy codes vary greatly from one area to another & may modify or overrule the code requirements shown in this book. Before beginning any project, check with your local building department to determine the codes that apply in your area.

Thanks to Hamid Naderi of ICC for his editorial input.

This file has bookmarks which can help quickly search for a specific topic; we recommend turning on your bookmarks through the view window. You can also navigate by using the "table of contents" button above and clicking on the page numbers there.

The buttons at the top of the page – table of contents, abbreviations, code changes, and glossary – take you immediately to those pages of the book. The left and right arrows at the upper corners can be used to advance or move forward one page at a time.

Every ICC code number is a hyperlink which will open an ICC E Codes file in your web browser. The text of each cited code will appear in your browser in a separate window.

TABLE 1 CODES & STANDARDS USED IN THIS BOOK		
Organization	Edition	Code
ASHRAE	2010	ASHRAE 62.2 Ventilation & Acceptable Indoor Air Quality in Low-Rise Residential Buildings
IAPMO	2009	Uniform Mechanical Code
ICC	2009	International Residential Code
NFPA	2011	NFPA 31 Standard for Installation of Oil-Burning Equipment
NFPA	2011	NFPA 58 Liquefied Petroleum Gas Code
NFPA	2010	NFPA 211 Standard for Chimneys, Fireplaces, Vents & Solid Fuel-Burning Appliances
NFPA	2011	NFPA 70 National Electrical Code

Licensed exclusively to US Inspect - copying or redistribution prohibited

TABLE 2 ORGANIZATIONS	
Acronym	Name
ACCA	Air Conditioning Contractors of America
ASHRAE	American Society of Heating, Air Conditioning & Refrigeration Engineers
ASME	American Society of Mechanical Engineers
ASTM	ASTM International (formerly the American Society for Testing & Materials)
CSA	Canadian Standards Association
IAPMO	International Association of Plumbing & Mechanical Officials
ICC	International Code Council
NFPA	National Fire Protection Association
UL	Underwriters Laboratories

KEY TO USING CODE CHECK

Code Check Mechanical condenses large amounts of code information by using several "shorthand" conventions that are explained here. Each rule described in Code Check begins with a checkbox and ends with the code citations. When only one code is shown, the code citation is inside of brackets, and when two codes are shown, the second code is shown inside of braces, as in the following example from p.6:

Maintain accessibility for service of gas appliances ____ [1305.1] {304.1}

This line is stating that all appliances must be accessible for service. The rule is found in section 1305.1 of the IRC & section 304.1 of the UMC. Clicking on the "1305.1" IRC reference will open a browser window directly to the code text.

References to figures & tables are preceded by an **F** or a **T** as in the following example from p.25:

Gas Vent Terminations

B vents ≤ 12 in. diameter per **F31, T8** if > 8 ft. from wall ____ [2427.6.4] {802.6.2}

*This line is stating that B vents more than 8 feet from a wall are to be installed in accordance with rules shown in Figure 31 & Table 8. Notice that clicking on **F31** or **T8** opens directly to the page containing that figure or table.*

A change from the previous code edition is shown by a code citation in a different color. The superscript blue number after the code citation refers to the table on p.46, where more information about the change is found. The following example is from p.22:

Single-Wall Vents

09 **IRC** **09** **UMC**

Not allowed in dwellings ____ [n/a] {802.7.4.1}

This line is saying that single-wall gas appliance vents are not allowed in dwellings. The IRC does not have such a rule, so the citation there is "n/a." In the UMC, the rule is in section 802.7.4.1 & it is a change from the 2006 edition. The change is explained further on p.46. Clicking on the superscript number takes you directly to p.46.

A line ending in EXC means that an exception to the rule is contained in the line that follows. The following example is from p.12:

C.A. req'd for natural draft appliances EXC ____ [2407.1] {701.1.1}

• Direct-vent appliances installed AMI____ [2407.1] {701.1X1}

These lines are stating that combustion air is required for natural draft appliances except direct-vent appliances installed in accordance with the manufacturer's instructions. The abbreviations C.A. & AMI are explained in the list on p.3.

ABBREVIATIONS

Licensed exclusively to US Inspect - copying or redistribution prohibited

AC	= air conditioning	L&L	= listed & labeled
ACH	= air changes per hour	Ib.	= pound(s)
AHJ	= Authority Having Jurisdiction	LP	= liquefied petroleum (LP gas)
AMI	= in accordance with manufacturer's instructions	manu	= manufacturer, manufacturer's
ASTM	= ASTM International, formerly the American Society for Testing & Materials	max	= maximum
AWG	= American Wire Gage	min	= minimum
BO	= building official	no.	= number
Btu	= British thermal unit	o.c.	= on center
C.A.	= combustion air	PE	= polyethylene tubing
cfm	= cubic feet per minute	PEX	= crossed-link polyethylene tubing
CPVC	= chlorinated PVC pipe	PL	= property line
cu.	= cubic, as in cubic feet	PRV	= pressure relief valve
Cu	= copper	psf	= pounds per square foot
EGV	= equipment grounding conductor	psi	= pounds per square inch
EXC	= exception to rule will follow in the next line	psig	= pounds per square inch gage
FAU	= forced-air unit (central heater)	PVC	= polyvinyl chloride pipe
ft.	= foot/feet	req	= require
gal	= gallon(s)	req'd	= required
gpm	= gallons per minute	req's	= requires
HP	= heat pump	SDC	= Seismic Design Category
hr	= hour(s)	sq.	= square, as in sq. ft.
in.	= inch(es)	TPRV	= temperature & pressure relief valve
kBtu	= 1,000 Btu	V	= volt(s)
		WH	= water heater(s)

GENERAL MECHANICAL SYSTEM REQUIREMENTS

The IRC & UMC have many sections that are identical except for their numbering. The model code for systems using natural gas is *NFPA 54-The National Fuel Gas Code* & many provisions of the more commonly adopted IRC & UMC are taken directly from it.

Administration

09 IRC 09 UMC

- | | | | |
|---|----------|---------|--|
| <input type="checkbox"/> New installations, alterations & repairs req permits EXC _____ | [105.1] | {112.1} | |
| • Portable equipment & minor replacement parts _____ | [105.2] | {112.2} | |
| • Components (including piping) within L&L equipment _____ | [105.2] | {112.2} | |
| <input type="checkbox"/> BO or AHJ may accept alternative materials, methods & equipment _____ | [104.11] | {105.0} | |
| <input type="checkbox"/> Installations not covered by IRC must comply with International Mechanical Code or International Fuel Gas Code _____ | [1301.1] | {n/a} | |
| <input type="checkbox"/> Continued use of existing installations OK if safe & compliant with code at time of construction _____ | [1202.2] | {104.2} | |

Listing & Labeling

09 IRC 09 UMC

- | | | | |
|--|-------------------|---------|--|
| <input type="checkbox"/> All appliances L&L EXC _____ | [1302.1] | {302.1} | |
| <input type="checkbox"/> UMC allows unlisted appliances if BO deems them safe _____ | [n/a] | {302.1} | |
| <input type="checkbox"/> Install listed appliances AMI & per listing _____ | [1307.1 & 1401.1] | {303.1} | |
| <input type="checkbox"/> Attach installation & operating instructions to appliance _____ | [1307.1] | {303.1} | |
| <input type="checkbox"/> Fuel-fired factory-applied nameplates must include: | [1303.1] | {306.1} | |
| • Manu name, model & serial number | | | |
| • Operating & maintenance instructions | | | |
| • Hourly Btu rating | | | |
| • Type of fuel | | | |
| • Req'd clearances from combustibles | | | |

Appliance Maintenance

09 IRC 09 UMC

- | | | |
|---|----------|---------|
| <input type="checkbox"/> Maintain system in proper working order _____ | [1202.3] | {104.4} |
| <input type="checkbox"/> BO may order reinspections to determine compliance _____ | [1202.3] | {104.4} |

Minimum heating requirements

09 IRC 09 UMC

- | | | |
|--|---------|-------|
| <input type="checkbox"/> Habitable rooms req installed heat source capable of min 68°F at 3 ft. above floor & 2 ft. from exterior wall _____ | [303.8] | {n/a} |
| <input type="checkbox"/> Portable space heater not OK to meet above rule _____ | [303.8] | {n/a} |

APPLIANCE ACCESS & LOCATION

Appliances must remain accessible for inspection, service, repair & replacement without the need to remove permanent construction. Appliances must be located where they are not subject to flooding or damage & with adequate clearances from combustible surfaces. Appliances in under-floor areas & attics have specific rules. The IRC does not address appliances on roofs, though it does state that in the absence of specific rules, those from the International Mechanical Code can apply.

Flood Elevation

09 IRC 09 UMC

- | | | |
|--|------------|-----------|
| <input type="checkbox"/> Locate above design flood elevation EXC _____ | [1301.1.1] | [307.2] |
| • If designed to prevent water entry & resist buoyancy | [322.1.6X] | [307.2] |
| <input type="checkbox"/> No equipment mounted on breakaway flood walls _____ | [322.3.4] | [307.2.1] |

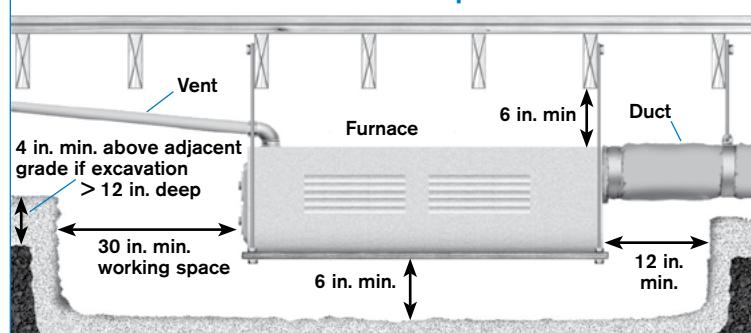

Appliance Access

09 IRC 09 UMC

- | | | |
|--|-------------|----------|
| <input type="checkbox"/> Maintain accessibility for service of gas appliances _____ | [1305.1] | {304.1} |
| <input type="checkbox"/> Min 30 x 30 in. level work space on control side EXC _____ | [1305.1] | {304.0} |
| • 18 in. deep space OK for room heaters _____ | [1305.1] | {304.0X} |
| <input type="checkbox"/> Equipment room door min 24 in. wide F32 _____ | [1305.1.2] | {n/a} |
| <input type="checkbox"/> Equipment must fit through door F32 _____ | [1305.1.2] | {304.0} |
| <input type="checkbox"/> Oil-burning FAUs in alcoves clearances per F32 EXC _____ | [1305.1.1] | {n/a} |
| • Replacement appliances clearances AMI _____ | [1305.1.1X] | {n/a} |

Appliances under Floors

- Access opening min rough-framed size 22 × 30 in. [1305.1.4] {904.11.1}
- Appliance must fit through opening [1305.1.4] {904.11.1}
- Passageway min 22 in. wide × 30 in. high [1305.1.4] {904.11.1}
- Passageway max 20 ft. long EXC [1305.1.4] {904.11.2}
 - Passageway ≥ 6 ft. high OK for unlimited length [1305.1.4X2] {904.11.2}
- Min 30 × 30 in. level space on service side **F1** [1305.1.4] {904.11.4}
- Support on concrete slab above ground or suspend from floor min 6 in. above ground **F1** [1305.1.4.1] {n/a}
- Excavations min 6 in. below appliance, 12 in. on sides, 30 in. on control side **F1** [1305.1.4.2] {n/a}
- If excavation > 12 in. below adjacent grade, line with concrete extending 4 in. above adjacent grade **F1** [1305.1.4] {n/a}
- Luminaire & receptacle outlet req'd near appliance [1305.1.4.3] {904.11.5}
- Switch for luminaire req'd at passageway entrance [1305.1.4.3] {904.11.5}

FIG. 1**Furnace in Crawl Space**

Licensed exclusively to US Inspect - copying or redistribution prohibited

09 IRC**09 UMC****Heating & Cooling Appliances in Garages**

- Ignition source min 18 in. above floor EXC [1307.3] {307.1}
 - Appliances in separate enclosed space accessible from outside garage & no combustion air from garage [1307.3] {307.1}
- Protect appliances from impact [1307.3.1] {307.1}
- Ducts through common wall to house min 26-gage steel [302.5.2] {n/a}
- No duct openings into garage [302.5.2] {n/a}
- Openings around duct penetrations through common wall sealed with approved materials [302.5.3] {n/a}

Heating & Cooling Appliances in Attics

- Rough-framed access opening min 22 × 30 in. [1305.1.3] {904.11.1}
- Appliance must fit through opening [1305.1.3] {904.11.1}
- Solid floor min 24 in. wide from entrance to appliance [1305.1.3] {904.11.3}
- Max 20 ft. from access opening to appliance EXC [1305.1.3]
 - 50 ft. OK if passageway ≥ 6 ft. high (unlimited length OK in UMC) [1305.1.3X2] {904.11.2}

- Min 30 × 30 in. level work platform EXC [1305.1.3] {904.11.4}
 - OK to omit if service possible from access opening [1305.1.3X1] {Ø}
- Luminaire & receptacle req'd near appliance **F17** [1305.1.3.1] {904.11.5}
- Switch for luminaire req'd at entrance **F17** [1305.1.3.1] {904.11.5}

Clearances from Combustibles

- Install with clearances AMI [1306.1 & 2409.3.1] {303.1}
- Appliances in rooms "large in comparison to size of equipment" (not in alcove) clearance reduction allowed **T9** [1306.2 & 2409.3.3] {303.2}
- Appliances installed in alcoves or closets must be L&L for same & no clearance reduction allowed [2409.3.2] {303.2X}

Licensed exclusively to US Inspect - copying or redistribution prohibited

AIR-CONDITIONING & HEAT PUMPS

Central air-conditioning efficiency is measured in seasonal energy efficiency rating (SEER) & heat pumps are measured in heating seasonal performance factor (HSPF). The numbers are higher as efficiency is increased. Min efficiency standards for heat pumps & air conditioners have increased in recent years. Tax credits have been available for consumers upgrading their equipment to meet or exceed certain standards. As of this writing, the Department of Energy min SEER is 13, the min for an Energy Star rating is 14 & the min for a tax credit is 16. When replacing an existing system, both the indoor & outdoor units will likely have to be replaced to qualify.

Air-Conditioning (AC) & Heat Pumps (HPs)

09 IRC 09 UMC

Factory-applied nameplates must include: _____ [1303.1] {306.3}

- Label with manu name, model & serial number
- Operating & maintenance instructions or publication number of manual
- Rating in volts, amperes & Btus or watts, no. of phases if > 1
- Req'd clearances

HP return air duct min 6 sq. in. per kBtu output _____ [1403.1] {manu}

Outdoor heat pump unit on min 3 in. raised pad **F2** _____ [1403.2]² {1106.2}

Furnace with cooling coil reqs pressure capacity min 0.5 in. water column or L&L for cooling _____ [1411.2] {904.8A&B}

Cooling coil downstream from heat exchangers unless L&L for upstream (stainless steel heat exchanger) _____ [1411.2] {904.8C}

Central AC req's air filter **F2** _____ [1401.1] {311.2}

Condenser not near clothes dryer vent _____ [manu] {manu}

Refrigerant vapor (suction) lines insulated min R4 **F2** _____ [1411.5] {manu}

Refrigerant tubing should be secured, supported & protected from damage as recommended by the manu. Underground tubing must be protected from corrosion, and typically req's a chase or conduit that should also be seen emerging above grade.

The [UL Marking and Application Guide for Electrical Heating & Cooling Equipment](#) contains additional information on the requirements & meaning of the label information.

Window & Through-Wall Units

09 IRC 11 NEC

- Must have equipment grounding conductor; no adapters to existing 2-slot receptacles _____ [3908.1] {440.61}
- Max cord length 10 ft. if 120V, 6 ft. if 240V _____ [manu] {440.64}
- Cord plug OK as disconnect if controls ≤ 6 ft. of floor _____ [manu] {440.63}
- Arc fault circuit interrupter (AFCI) or leakage current detection interrupter (LCDI) req'd in attachment plug _____ [manu] {440.65}
- Max load rating 80% of individual circuit _____ [3702.12.1] {440.62B}
- Max load rating 50% of shared circuit _____ [3702.12.2] {440.62C}

Condensate Disposal

09 IRC 09 UMC

- Condensate may not drain to public way _____ [1411.3] {309.1}
- Drainpipe min ¾ in. with min 1/8 in./ft. slope **F2** _____ [1411.3] {309.1}
- Threaded female PVC fittings only on plastic male _____ [manu] {309.5}
- May drain to indirect waste (lavatory tailpiece, tub overflow) or other approved location **F2** _____ [1411.3] {309.1}
- No direct connection to waste or vent pipe _____ [1411.3] {309.1}
- If condensate stoppage would damage building components, install one of the following methods: **F2** _____ [1411.3.1] {309.2}
 - Secondary drain to conspicuous point of disposal _____ [1411.3.1] {309.2}
 - Auxiliary drain pan with drain to conspicuous point _____ [1411.3.1] {309.2}
 - Auxiliary drain pan with detector & drain fitting _____ [1411.3.1] {n/a}
 - Water level detection in primary with interlocked cutout _____ [1411.3.1] {n/a}
- Down-flow units with no secondary & no way to install auxiliary drain pan req internal blockage detector with interlocked cutout _____ [1411.3.1.1] {n/a}
- No drilling (saddle fittings) of drain, waste, or vent (DWV) pipes to accept condensate drain _____ [3003.2] {UPC}

Licensed exclusively to US Inspect – copying or redistribution prohibited

FIG. 2

Heat Pump Operating in Cooling Mode

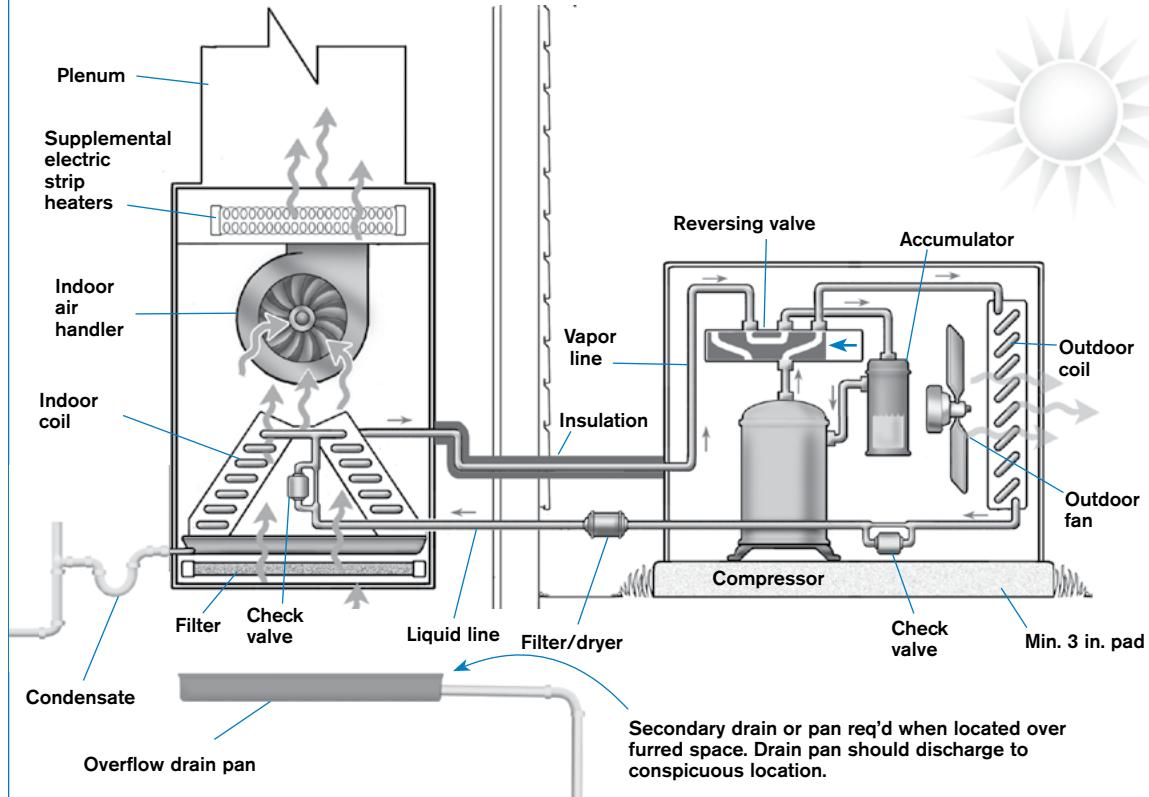

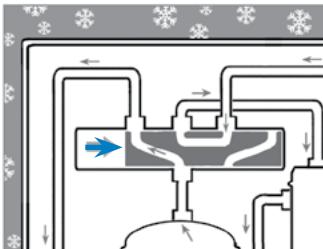

FIG. 3

Reversing Valve in Heating Mode

Heat pumps can be used for both heating & cooling.

A reversing valve determines the direction of refrigerant flow.

In heating mode, the outdoor coil extracts heat from the atmosphere & the indoor coil gives up that heat to the interior space.

When the outdoor temperature is below the balance point, supplementary electric strip heaters are activated in the indoor air handler.

In cooling mode, the system operates as in F2.

Licensed exclusively to US Inspect - copying or redistribution prohibited
Insulation in Unconditioned Space

09 IRC 09 UMC

FIG. 7 Evaporative (Swamp) Cooler

Hot outside air is pulled through moist pads where it is cooled by evaporation & circulated through the house or building by a large blower, leaving the air much cooler & slightly more humid than when it entered the cooler. Evaporative cooling is especially well suited for climates where the air is hot & humidity is low.

| <input type="checkbox"/> PRV drain piped to within 18 in. of floor or receptor _____ | [2002.4] {1006.0} |

FIG. 19

Expansion Tank

As water temperature increases & pressure rises, expanded water pushes against the diaphragm & compresses the air, preventing excessive pressure in the piping.

The tank must be sized per **T4** for the total volume in the system, including the water in the boiler. The tank support must be designed for twice the waterlogged weight of the tank.

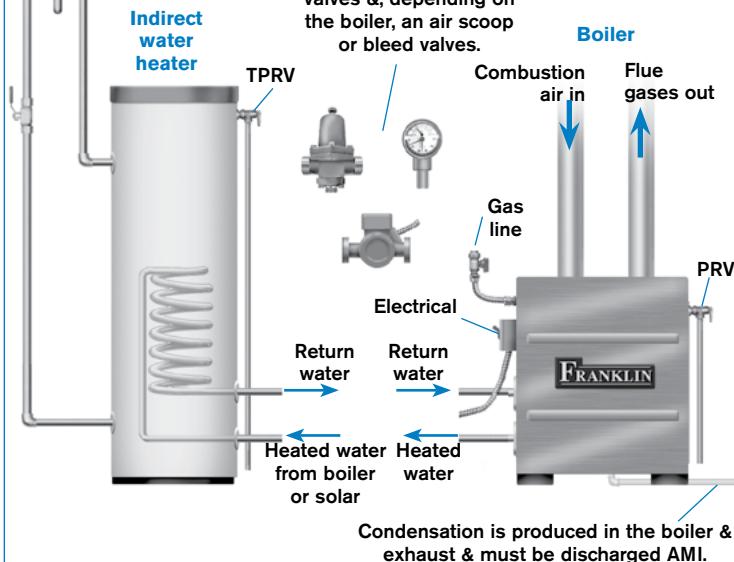

FIG. 20

Boiler & Indirect WH

Water from tank can reach scalding temperatures & must be tempered by a thermostatic mixing valve.

In addition to the expansion tank **F19**, every boiler must have a shutoff valve, pressure reducing regulator, temperature & pressure gauge, pumps, check valves &, depending on the boiler, an air scoop or bleed valves.

Boilers can serve as a heating system & can provide the energy source for an indirect-fired WH. A single high-efficiency boiler can be the energy plant for the whole house.

Licensed exclusively to US Inspect - copying or redistribution prohibited

Hydronic Piping: General

09 IRC 09 UMC

- Provide means of system drain down _____ [2101.2] {1201.2.7.8.8}
- Maintain backflow protection to potable water _____ [2101.3] {UPC 603.0}
- No contact with material causing corrosion or damage [2101.5] {1201.2.7.8.5}
- Drilling, notching & protection per building code _____ [2101.6] {1201.2.7.4}
- Provide for expansion & contraction _____ [2101.8] {1201.2.7.5}
- Enter tee fittings on supply side NOT branch opening [2101.7] {n/a}

Exposed Piping

09 IRC 09 UMC

- Support piping to avoid strain _____ [2101.9] {1201.2.6}
- Pressure test min 100psi water for 15 {30 UMC} minutes [2101.10] {1201.2.8.3}
- Wrap/sleeve pipes through concrete walls or floors _____ [2603.3] {1201.2.7.8.1}

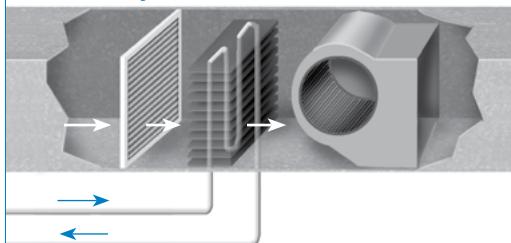

FIG. 21

Hydronics

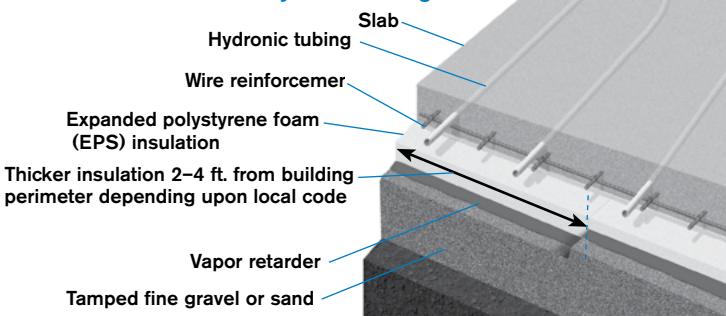

Hydronic heating can be distributed through baseboard convectors, duct heaters, or in-slab radiant heating in either slab-on-grade construction or raised floors.

Each zone will have its own thermostat & typically its own circulation pump or zone valve. Return lines will typically have manifolds that combine various sections of hydronic tubing.

Hydronic Duct Heater

Hydronic Tubing in Slab

GAS FLOOR FURNACES

In addition to these specific rules for gas-burning floor furnaces, the access & passageway illumination requirements on p.7 also apply. Grills for these furnaces can be hot & care must be taken to protect young children from them.

Underfloor Area

09 IRC 09 UMC

- Must be L&L & installed AMI _____ [2437.1] {912.1A}
- Unlisted furnaces only in noncombustible floors _____ [Ø] {912.1B}
- Appliance must fit through access opening _____ [1305.1.4] {304.0}
- IRC access opening min 22 x 30 in. (UMC trap door min 24 in. & wall opening 18 x 24 in.) _____ [1305.1.4] {912.8}
- May not be in concrete slab on grade _____ [2437.2] {912.1A}
 - May not project into habitable space below _____ [2437.5&6] {912.11}

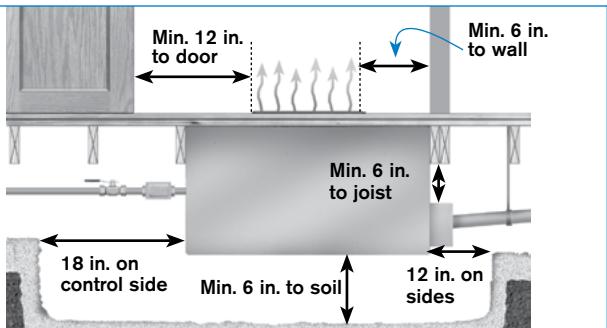

Excavation Clearances

09 IRC 09 UMC

- 6 in. to ground (2 in. if factory sealed) **F22** _____ [2437.4] {912.7}
- 12 in. side clearance; 18 in. on control side **F22** _____ [2437.4] {912.7}

FIG. 22

Floor Furnace

Above Floor

09 IRC 09 UMC

- Not in doorway, landing, passageway, or exit way _____ [2437.2] {912.4}
- Flat-register type min 6 in. from wall **F22** _____ [2437.2] {912.4B}
- Min 12 in. from door swing or draperies **F22** _____ [2437.2] {912.4C}
- Two adjoining sides must have 18 in. clearance _____ [2437.2] {912.4B}
- Wall-register type min 6 in. to inner corner _____ [2437.2] {912.4B}
- Thermostat must be in same room _____ [2437.2] {912.1C}

GAS WALL FURNACES

Gas-fired wall furnaces that are not direct vent can be located only in rooms that are large enough to meet the combustion air requirements of the appliance. Because they need indoor air for combustion, they are typically found only in older buildings with high air infiltration rates. If a building is upgraded in terms of energy compliance, it might not be possible to use wall furnaces as the heat source. Vent installation on wall furnaces is especially important, in that clearances inside the wall are less than the normal minimums for B vents. When a wall furnace is installed in an existing building, one side of the wall above the furnace should be opened for inspection of vent clearances.

Clearances

09 IRC 09 UMC

- From sidewall—install AMI (typical 6 in. min) **F23** _____ [2436.3] {928.1&2}
- From door swing [IRC: 12 in.] {UMC: AMI} **F23** _____ [2436.4] {928.1&2}
- Do not rely on doorstops to maintain clearance _____ [2436.4] {928.2}
- Clearance below structural projections AMI (typical 18 in.) [2436.3] {928.1&2}

Furnace Installation

09 IRC 09 UMC

- OK in bedroom or bath that is not confined space _____ [2406.2] {902.0B}
- Fan assist only if L&L & AMI _____ [2436.1] {304.1}
- No ducts attached to wall furnaces _____ [2436.5] {928.1A}
- Panels, grills & access doors not attached to walls _____ [2436.6] {928.1E}
- Header plate at top of furnace AMI _____ [2436.1] {928.1C}
- Stud bay depth AMI _____ [2436.1] {928.1A}
- Unlisted furnaces not OK in combustible construction _____ [2404.3] {928.1B}

Licensed exclusively to US Inspect - copying or redistribution prohibited

FIG. 23

Wall Furnace Clearances

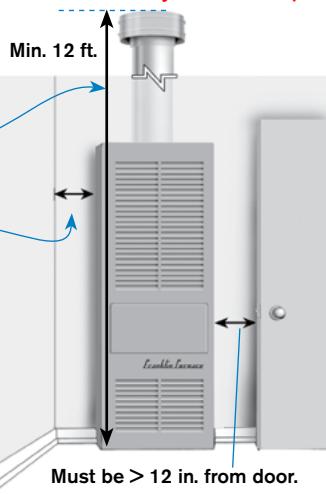

Vent termination min. 12 ft. above furnace bottom

Furnace must not be too close to corner.

Typical manu specification is 6 in. from inside corner.

Drapery must not touch heater.

Wall furnaces must remain accessible for cleaning. Dust or lint accumulating on the burner assembly can restrict the flow of oxygen necessary for complete combustion.

Vent Installation

09 IRC 09 UMC

- Cut top & floor plates flush to stud F24 [2427.6.1] {928.1C}
- Furnace stud space vented by ceiling plate spacers AMI F24 [2427.6.1] {928.1C}
- Subsequent ceiling stud plates firestopped AMI F24 [2427.6.1] {928.1C}
- Single-story systems OK only in single story or top of multistory [2427.6.1] {928.1C}
- Multistory systems OK in single story or multistory [2427.6.1] {928.1C}
- Sleeve around vent in insulated assembly F25 [2426.4] {n/a}
- Sleeve min 2 in. above insulation in insulated attic F25 [2426.4] {n/a}
- Vent min height 12 ft. above bottom of furnace F23 [2427.6.4] {802.6.2.2}

FIG. 24

Wall Furnace Flue

Subsequent floors above floor/ceiling line of furnace space req firestop spacers.

Stud space of furnace vented by spacer supplied with vent.

Floor/ceiling line above wall furnace

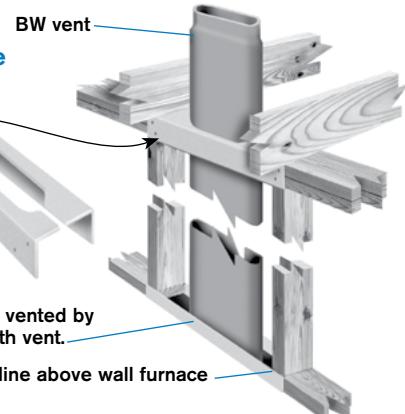

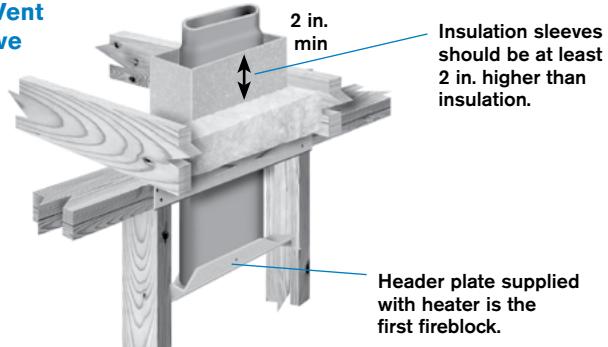

FIG. 25

BW Vent Sleeve

Licensed exclusively to US Inspect - copying or redistribution prohibited

ROOM HEATERS

Room heaters that are not direct vent must be supplied with sufficient combustion air from the interior & are typically found only in older buildings with high air-infiltration rates. Because these must connect to a venting system, they should be secured to prevent displacement of the vent. Though unvented heaters are recognized in the model codes, many jurisdictions prohibit their use. If they are in bedrooms or baths they should be provided with a nontamperable oxygen depletion sensor.

General

- Secure to floor _____ [1307.2] {303.4}
- Install AMI _____ [2446.1] {303.1}
- Flame safeguard (pilot safety) req'd _____ [2446.1] {305.0}

Unvented Heaters

- | 09 IRC | 09 UMC |
|---|----------------------|
| <input type="checkbox"/> Unvented heater may NOT be sole heat source _____ | [2445.2] {924.1} |
| <input type="checkbox"/> Unvented heater ≤ 6kBtu OK in bath _____ | [2406.2] {924.1.1X1} |
| <input type="checkbox"/> Unvented heater ≤ 10kBtu OK in bedroom _____ | [2406.2] {924.1.1X2} |

| <input type="checkbox"/> Max input ratings ≤ 20Btu/cu. ft. of room or space _____ | [2445.5] {n/a} |
| <input type="checkbox"/> Adjacent spaces with permanent large openings (doorway or archway) part of room volume _____ | [2445.5] {701.2} |
| <input type="checkbox"/> Unvented heater req's oxygen-depletion sensor _____ | [2445.6] {924.1.1X} |

DIRECT-VENT APPLIANCES

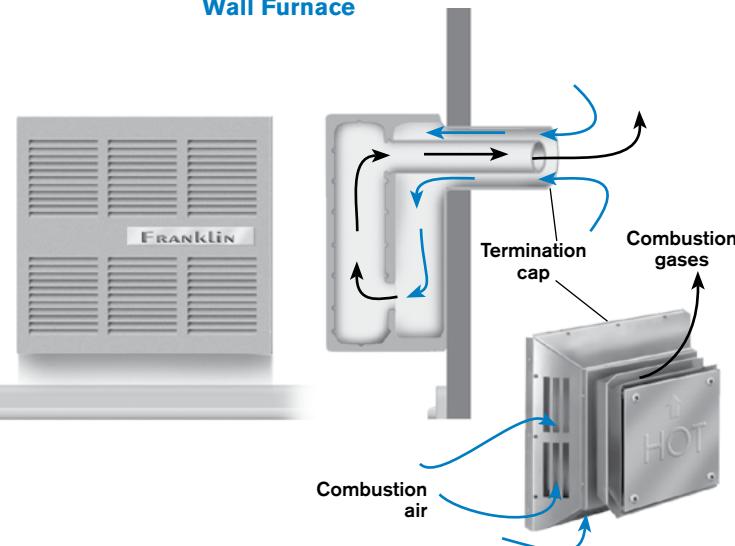

Direct-vent appliances draw their source of combustion air from the same area where they vent combustion gases. This arrangement equalizes pressure on the inlet & outlet of the firebox, which is sealed & has no open flame on the building interior. Because these appliances do not use the interior air for combustion, they can be located in rooms that are considered confined spaces.

Direct-Vent Gas Wall Heaters F26

- | 09 IRC | 09 UMC |

FIG. 27

Direct-Vent Gas Fireplace

A direct-vent fireplace can vent horizontally out a sidewall or vertically to the roof. With a completely enclosed chamber, it draws in outside air for combustion & expels gases to the outside. The front glass enclosure allows radiant heat to pass into the room. It heats a room without robbing it of oxygen or of the heated air it provides & keeps it free of fumes & combustible materials, such as embers or ash.

Direct-Vent Appliance Vent Termination**09 IRC 09 UMC**

- OK to terminate through wall **F26.27** _____ [2427.8] {802.8.3}
- Termination clearances **T5** _____ [2427.8] {802.8.3}
- Bottom of vent terminal min 12 in. above grade _____ [2427.8] {802.8.3}

TABLE 5**DIRECT VENT TERMINATION CLEARANCES FROM BUILDING OPENINGS [2427.8] {802.8.3}**

Appliance Rating	Clearance ^A from Openings
≤ 10kBtu	6 in.
> 10kBtu to 50kBtu	9 in.
> 50kBtu	12 in.

A. Measure stretched-string distance from edge of vent opening.

GAS APPLIANCES IN FIREPLACES**Vented Decorative Appliances in Fireplaces****09 IRC 09 UMC**

- Not allowed in bedroom if confined space _____ [2406.2] {907.1}
- Must be L&L & installed AMI _____ [2432.1] {907.2}
- Maintain open vent (block damper in open position) _____ [manu] {manu}
- Fireplace screen req'd _____ [manu] {907.3}
- Appliance with pilot or ignition system req's pilot safety _____ [2432.2] {305.0}
- Shutoff inside firepit OK if AMI _____ [2420.5.1] {1313.4}

Log Lighters**09 IRC 09 UMC**

- Log lighters must be AMI _____ [2433.1] {manu}
- Req'd valve ≤ 6 ft. of fireplace & in same room _____ [2420.5] {1313.4}
- Hard gas pipe inside firepit (no flex) _____ [2422.1.1] {1313.1}

Unvented Gas Log Heaters**09 IRC 09 UMC**

- Not in factory-built fireplace unless L&L to UL127 & AMI [1004.4] {n/a}

Licensed exclusively to US Inspect - copying or redistribution prohibited

GAS APPLIANCE VENTING

Common forms of gas appliances, like WHs, have traditionally used a "gravity" vent system, where combustion gases are lighter than the surrounding air, so they rise by gravity to the outdoors. As appliances are becoming more efficient, other types of venting systems are being used, as shown in **T6**. The type of vent should match the appliance category & the manu's recommendations. The venting tables that are supplied by the manu & shipped with gas appliances must be used in vent systems that include induced draft appliances. Those tables are also in the codes.

TABLE 6 APPLIANCE VENTING CATEGORIES

Category	Condensation	Static Pressure	Typical vent
I	No	Nonpositive	B Vent
II	Yes	Nonpositive	AMI
III	No	Positive	Stainless
IV	Yes	Positive	Plastic

General

09 IRC 09 UMC

- Choose vent material based on appliance category **T6** [2427.1] {802.1}
- Category I induced draft is "gravity" vent appliance [2427.1] {802.1}
- Select type of venting system from **T7** [2427.4] {802.4.1}
- Properly support all vents AMI [2426.6] {802.6.5}
- All vents L&L except plastic installed AMI or single wall [2426.1] {n/a}
- Plastic vents AMI & primer contrasting color [2427.4.1.1]^b {802.4.3}^b
- Condensate drain also req'd for Category I or III if local experience shows need (recommended for some tankless WH) [2427.8&9] {802.9.2}
- Sheet-metal shield to 2 in. above attic insulation **F29** [2426.4] {n/a}
- Protect vents closer than 1½ in. from face of wall with steel shield plates extending min 4 in. beyond framing inside wall [2426.7] {n/a}
- No solid fuel & gas in same chimney flue [2427.5.6.1] {802.5.5.1}
- Size Category II, III & IV appliance vents AMI [2427.6.8.3] {802.6.3.2}

TABLE 7 TYPE OF VENTING SYSTEM TO BE USED [T2427.4] {T8-1}

Appliances	Type of Vent	IRC	UMC
Listed Category I Listed appliances with draft hoods Appliances listed for B vent	Type B gas vent	2427.6	802.6
	Chimney	2427.5	802.5
	Single-wall metal pipe	2427.7	Ø
	Listed chimney lining for gas	2427.5.2	802.5.1.3
	Special vent listed for appliance	2427.4.2	802.4.3
Listed vented wall furnaces	Type B-W gas vent	2427.6	802.6 928.0
Category II, III & IV appliances	AMI	2427.4.1	802.4.2
		2427.4.2	802.4.3
Unlisted appliances	Chimney	2427.5	802.5
Decorative appliances in vented fireplaces	Chimney	2427.5	907.2
Direct-vent appliances	AMI	2427.2.1	802.2.5
Appliances with integral vent	AMI	2427.2.2	802.2.6

Single-Wall Vents

09 IRC 09 UMC

- Not allowed in dwellings [n/a] {802.74.1}^b
- Only for runs from appliance space directly to outside [2427.7.4] {n/a}
- May not originate in attic or pass through inside wall [2427.7.6] {n/a}
- Min 6 in. clear to combustible for single wall pipe [2427.7.8] {n/a}
- Termination min 2 ft. above roof [2427.7.3] {n/a}
- Termination min 2 ft. higher than building within 10 ft. [2427.7.3] {n/a}
- Not allowed outdoors in cold (freezing) climates [2427.7.2] {n/a}

Licensed exclusively to US Inspect - copying or redistribution prohibited

Appliances typically ship with installation instructions that include the tables in IRC 2428.2 & UMC 8-5.

Vent Size Tables

09 IRC 09 UMC

- Tables can be used for all Category I appliances ____ [2427.6.8.1] {802.6.3.1}
- Connector req'd to be sized per tables ____ [2427.10.3.1] {802.10.3.1}
- Connector not > 2 sizes larger than flue collar ____ [2428.3.17] {803.1.10}
- When vertical vent > than connector, use vertical diameter to determine table min & connector diameter for table max ____ [2428.2.8] {803.1.7}
- Use double-wall vent tables only for vents not exposed to outdoors below roofline (B vent in unvented chase insulated to R-8 or in unused masonry chimney flue not considered outdoors) ____ [2428.2.9] {803.1.8.1}
- Zero lateral values only if straight vertical vent connects directly to top outlet draft hood or flue collar ____ [2428.2.4] {803.1.3}
- No elbows if using "zero lateral length" part of table ____ [2428.2.3] {803.1.2}
- Vent tables with lateral length allow for 2-90° elbows ____ [2428.2.3] {803.1.2}
- Reduce table capacity 5% each elbow up to 45° & 10% each elbow > 45° up to 90° ____ [2428.2.3] {803.1.2}
- Reductions for elbows in common vents as above ____ [2428.3.6] {803.2.6}
- Reductions for common vent connectors as above ____ [2428.3.7] {803.2.7}

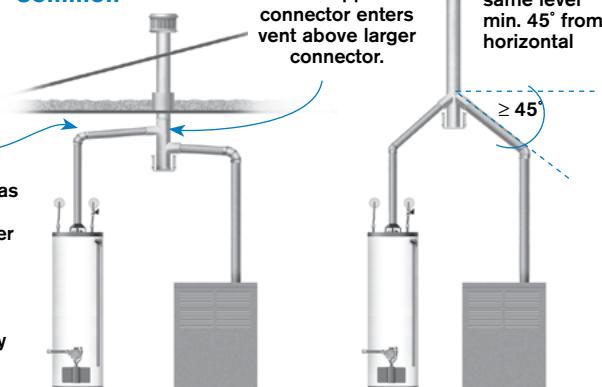

Multiple Appliances Vented in Common

09 IRC 09 UMC

- Tables req'd to be used if induced draft included ____ [2427.10.3.3] {802.10.3.3}
- Join multiple connectors as high as possible per available headroom & clearance F28 ____ [2427.10.3.4] {802.10.3.4}
- Connect smaller above larger EXC F28 ____ [2427.10.4] {802.10.4.1}
 - OK if both at same level if max 45° from vertical ____ [2427.10.4.1] {802.10.4.1}
- If both appliances have draft hoods, OK to size vent for 100% of larger + 50% of smaller ____ [2427.10.3.4] {802.10.3.4}
- Reduce connector table capacity 5% each elbow up to 45° & 10% each elbow > 45° up to 90° F28 ____ [2428.3.7] {803.2.7}

FIG. 28

Venting in Common

Forced Vents (Category IV)

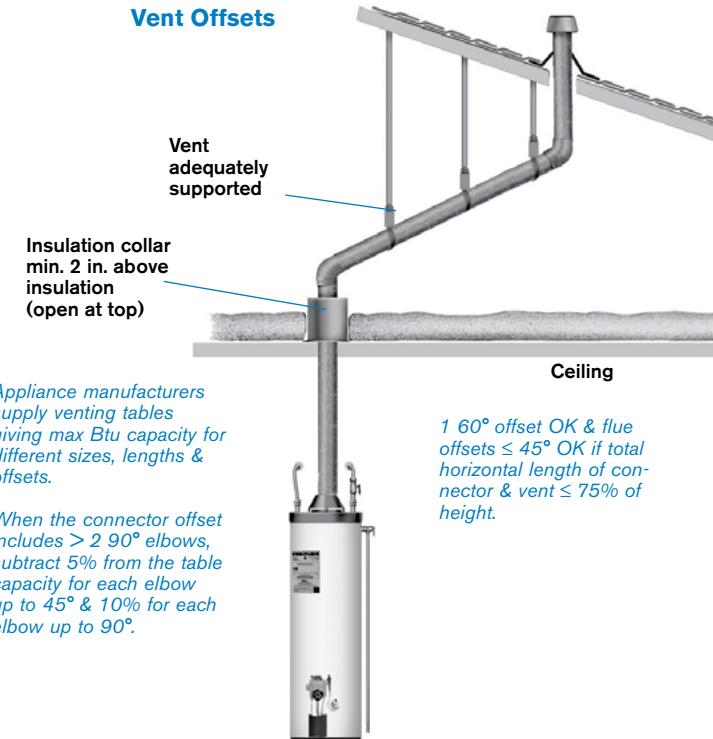

09 IRC 09 UMC

- All mechanical draft systems L&L & installed AMI ____ [2427.3.3] {802.3.4.1}
- Forced draft system must be gas tight ____ [2427.3.3] {802.3.4.3}
- No natural & forced-vent to common flue ____ [2427.3.3] {802.3.4.4}
- Terminate min 7 ft. above ground where adjacent to public walkways ____ [2427.3.3] {802.3.4.6}
- Terminate 3 ft. above forced air inlets within 10 ft. ____ [2427.8] {802.8.1}
- Terminate min 4 ft. to side or below or 1 ft. above building openings, min 1 ft. above ground level EXC ____ [2427.8] {802.8.2}
 - Termination same as direct vent (p.21) if AMI T5 ____ [2427.8] {802.8.1&2}
- Collect & dispose of condensate from vent (see p.8) ____ [2427.9] {802.9}

Licensed exclusively to US Inspect - copying or redistribution prohibited

FIG. 29

Vent Offsets

Connectors: General

- Must be as straight as practical _____ [2427.10.6] {802.10.6}
- Min 1/4 in./ft. slope toward appliance **F28** _____ [2427.10.8] {802.10.8}
- No dips or sags _____ [2427.10.8] {802.10.8}
- Must be as short as practical _____ [2427.10.9] {802.10.9.1}
- Provide adequate support **F29** _____ [2427.10.10] {802.10.10}
- Entire connector must be accessible _____ [2427.10.12] {802.10.12}
- Attach to appliance with screws or AMI _____ [2427.10.7] {802.10.7}
- Necessary size increases req'd to be made only at appliance outlet connection _____ [2427.10.3.5] {802.10.3.5}
- Max horizontal 18 in. per in. of connector diameter _____ [2428.3.2] {803.2.2}

Single-Wall Connectors for Category I Appliances 09 IRC 09 UMC

- No single wall in attic, crawl space, or other unconditioned space EXC _____ [2427.10.2.2] {802.10.2.2}
- OK [in unconditioned basement or garage] within exterior walls if local 99% winter design temperature $\geq 5^{\circ}\text{F}$ _____ [2427.10.2.2X] {802.10.2.2X}
- Horizontal connector max 75% of vertical vent _____ [2427.10.9] {802.10.9.2}
- Min 6 in. clearance to combustibles _____ [2427.10.5] {802.10.5}
- May not pass through interior wall, floor, or ceiling _____ [2427.10.14] {802.10.14.1}

Type B Double-Wall Vent Connectors

09 IRC 09 UMC

- Min clearance to combustibles per L&L (typical 1 in.) _____ [2427.10.5] {802.10.5}
- Max horizontal length 100% of vertical vent _____ [2427.10.9] {802.10.9.3}

Connectors to Chimneys

09 IRC 09 UMC

- Inspection req'd before connecting to existing chimney [2427.5.5] {802.5.4}
- Must be lined with clay or metal EXC _____ [2427.5.5.1] {802.5.4.2}
- OK for replacement of like appliance if inspecte _____ [2427.5.5.1]¹⁰ {802.5.4.2}¹⁰
- Enter chimney above bottom (min 12 in.IRC) _____ [2425.9] {802.10.11}
- Chimney cross-sectional area not $> 7 \times$ size of gas vent [2427.5.4] {802.5.3}

Licensed exclusively to US Inspect - copying or redistribution prohibited
Vent Terminations (cont.)

Connectors to Chimneys (cont.)**09 IRC 09 UMC**

- No connection to chimney serving solid fuel _____ [2427.10.13] {802.10.13}
- Secure connector to prevent blocking chimney _____ [2427.10.11] {802.10.11}
- No decorative shrouds unless L&L & AMI _____ [2427.5.3] {802.5.2.4}

Vent Size (Appliances with Draft Hoods)**09 IRC 09 UMC**

The simplified rules in this section can be used in addition to the prescriptive rules on p.23 and in the tables that come with the appliance.

- Min size same as flue collar _____ [2427.6.8.1] {802.6.3.1}
- Max size 7x area of smallest flue collar _____ [2427.6.8.1] {802.6.3.1}
- If 2 appliances, 100% of larger + 50% of smaller _____ [2427.6.8.1] {802.6.3.1}
- Offsets 45° max except one of 60° OK **F29** _____ [2427.6.8.2] {802.6.1.1}

Gas Vent Terminations**09 IRC 09 UMC**

- Gas vents must extend above roof EXC _____ [2427.6.3] {802.6.2}
 - Direct-vent appliances _____ [2427.6.3] {802.6.2}
 - Appliances with integral vents _____ [2427.6.3] {802.6.2}
 - Mechanical-draft appliances AMI (see p.23) _____ [2427.6.3] {802.6.2}
- Roof penetration req's flashing _____ [2427.6.5] {802.6.1}
- Must have listed cap (cannot end inside roof jack) _____ [2427.6.5] {802.6.1}
- Decorative shrouds only if L&L & AMI _____ [2427.6.3.1] {802.6.2.4}
- Chimneys min 3 ft. above roof **F30** _____ [2427.5.3] {802.5.2.1}
- Chimneys min 2 ft. higher than building within 10 ft. **F30** [2427.5.3] {802.5.2.1}
- Vent termination min 5 ft. vertical above flue collar _____ [2427.6.4] {802.6.2.1}
- B vents ≤ 12 in. diameter per **F31, T8** if > 8 ft. from wall _____ [2427.6.4] {802.6.2}
- B vents min 2 ft. above vertical walls within 8 ft. **F31** _____ [2427.6.3] {802.6.2}
- B vents > 12 in. diameter min 2 ft. above roof & per **F30** [2427.6.4] {802.6.2}
- Type B or L min 5 ft. vertical above flue collar _____ [2427.6.3] {802.6.2.1}
- Wall furnace min 12 ft. from bottom of furnace **F23** _____ [2427.6.4] {802.6.2.2}
- Direct vent per **T5** _____ [2427.8] {802.8.3}

09 IRC 09 UMC

Licensed exclusively to US Inspect - copying or redistribution prohibited

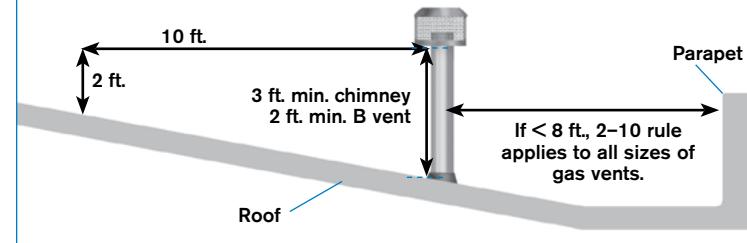

Vent Terminations (cont.)

"L" vent (oil vent used for gas or oil) termination:

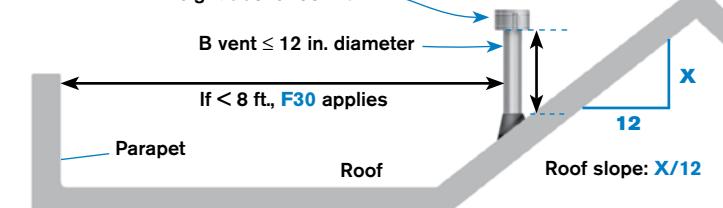

- Min 2 ft. above roof **F30** _____ [1804.2.4] {801.2}
- Min 2 ft. above any portion of building within 10 ft. **F30** [1804.2.4] {801.2}

OIL-FIRED APPLIANCES

The IRC provides specific rules for oil-burning appliances in Chapters 14 & 18. The UMC defers to NFPA 31 for these appliances. Jurisdictions using the UMC would use the NFPA 31 columns below.

General

- Appliance clearances AMI EXC _____ [1306.1] {4.3.2}
 - New central furnaces in closets req clearances to **F32** [1305.1.1] {n/a}
- Oil shutoff valve req'd _____ [2204.2] {10.5.1}

Oil-Fired Floor Furnaces

- 09 IRC NFPA 31**
- Must be L&L for combustible construction _____ [1408.1] {10.9.1}
- Install AMI _____ [1408.1] {4.3.2}
- Floor register types min 6 in. from wall _____ [1408.3] {10.9.4}
- Wall register type min 6 in. from inside corners _____ [1408.3] {10.9.5}
- Min 12 in. from draperies or door in any position _____ [1408.3] {10.9.4}
- Draperies OK above furnace if min 5 ft. clearance _____ [1408.3] {n/a}
- Not OK to project into habitable space below _____ [1408.3] {10.9.9}
- Must be supported independently of grill _____ [1408.5] {10.9.3}
- Not OK to support from ground _____ [1408.5]
- Furnace must be accessible (not OK in slab) _____ [1408.3&4] {10.9.7}

Oil-Fired Floor Furnaces (cont.)

- 09 IRC NFPA 31**
- Opening to underfloor area min 18 x 24 in. EXC _____ [1408.4]
 - Floor trap door min 22 x 30 in. _____ [1408.4] {n/a}
- Min 6 in. clearance to ground _____ [1408.5] {10.9.6}
- Min 6 in. clearance to sides below floor _____ [n/a] {10.9.9.2}
- Provide adequate combustion air AMI _____ [1701.1] {10.9.8}
- Chimney connector clearance min 9 in. EXC _____ [1803.3.4] {10.9.11}
 - Lesser clearances with clearance reduction system **T9** _____ [1803.3.4] {10.9.11}

Oil-Fired Recessed Wall Furnaces

- 09 IRC NFPA 31**
- Must be L&L for combustible construction _____ [1409.1] {10.13.1}
- Install AMI _____ [1409.1] {10.13.3}
- Locate so no fire hazard to walls, floors, or furnishings _____ [1409.2] {10.13.4}
- No doors within 12 in. of face of furnace _____ [1409.2] {10.13.4}
- Doorstop cannot be used to maintain req'd clearance _____ [1409.2] {10.13.4}
- Min 3 ft. from wall opposite register _____ [1409.1] {10.13.5}
- Panels, grills & access doors not attached to walls _____ [1409.4] {10.13.6}
- Provide adequate combustion air _____ [1701.1] {10.13.7}

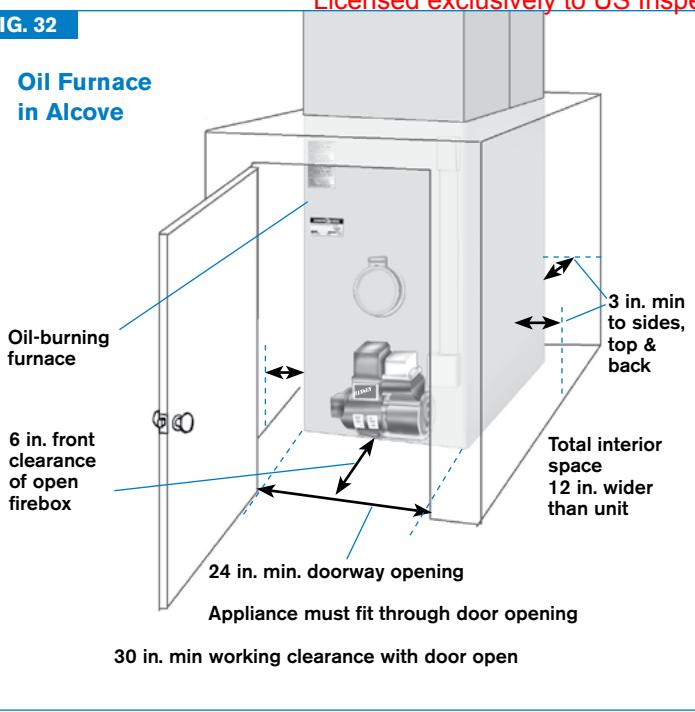

Oil-Fired Room Heaters

- 09 IRC NFPA 31**
- Must be L&L & installed AMI _____ [1410.1] {n/a}
- Noncombustible floor or assembly min 18 in. (12 in. NFPA 31) beyond all sides of appliance EXC _____ [1410.2] {10.6.3.1}
 - Appliances L&L for installation AMI without protection [1410.2X] {10.6.3}
- Clearances 24 in. front, 6 in. sides, rear & above _____ [manu] {T10.6.1}

Licensed exclusively to US Inspect - copying or redistribution prohibited

FIG. 32

Oil Furnace in Alcove

COMBUSTION AIR FOR OIL-FIRED APPLIANCES

The IRC no longer includes a separate set of rules for combustion air for oil-burning appliances & instead simply refers to NFPA 31.

General

- Source from outside building if unusually tight construction _____ {5.2.1}
- Consider effect from exhaust fans (kitchen, bath, laundry) _____ {5.2.3}
- Screen req'd on outside openings, mesh openings \geq 1 in. _____ {5.6.2}
- Consider restrictive effect of louvers on openings:
 - Net free area 60–75% for metal louvers
 - Net free area 20–25% for wood louvers

NFPA 31

Indoor Air Source

- OK only for buildings of ordinary tightness _____ {5.3.1}
- Infiltration sufficient for unconfined space _____ {5.3.1}
- Unconfined space $= \geq 50$ cu. ft./kBtu/hr. of all appliances in space **F16** _____ {3.3.60}
- Confined space req's openings to unconfined space _____ {5.4.1.3}
- Openings to unconfined space min 1sq. in./kBtu/hr. **T3** _____ {5.4.1.2}
- Openings located near top & bottom of confined space **F15** _____ {5.4.1.1}

NFPA 31

Outside Air Source

- Openings located near top & bottom of confined space **F11** _____ {5.4.2.1}
- Openings to vented attic or crawlspace equivalent to outdoors **F13** _____ {5.4.2.2}
- Direct exterior openings each sized at 1sq. in./4kBtu/hr. **T3, F11** _____ {5.4.2.3}
- Vertical ducts each sized at 1sq. in./4kBtu/hr. **T3, F8, 9** _____ {5.4.2.3}
- Horizontal ducts each sized at 1sq. in./2kBtu/hr. **T3, F12** _____ {5.4.2.3}

NFPA 31

Licensed exclusively to US Inspect - copying or redistribution prohibited

OIL-FIRED APPLIANCE CHIMNEYS & VENTS

Oil-fired appliances can be vented to listed L vents or to masonry or listed chimneys. IRC Chapter 18 deals with this subject. The UMC defers to NFPA 211 for oil-fired appliances, though NFPA 31 also contains similar rules. NFPA 211 does not address as many topics on oil-fired vents as NFPA 31 & for consistency with the rest of the codes in this section we are providing the NFPA 31 rules below.

General

09 IRC NFPA 31

- Appliances must be listed _____ [1302.1] {13.2}
- Fuel-burning appliances req venting to outdoors _____ [1801.1] {6.2.1}
- Vent system AMI of connected appliance _____ [1801.2] {6.3.1}
- Draft regulator req'd if connected to chimney **F33** EXC_ [1802.3] {6.4.1}
 - Arrangements that prevent excessive chimney draft _____ [n/a] {6.4.1}
 - Appliances L&L for use without draft regulator _____ [n/a] {6.4.1}
- No manually operated dampers _____ [1802.2.1] {6.4.2}
- Automatic dampers req burner interlock _____ [1802.2.2] {6.4.3}
- Unused openings not OK in vent system _____ [1801.10] {n/a}

Chimneys & Type L Vents

09 IRC NFPA 31

- Chimneys min size \geq flue collar, max size $3 \times$ _____ [1805.3.1] {manu}
- Inspect chimney before installing replacement appliance _____ [n/a] {6.6.7}
- Installer to verify that chimney is proper size _____ [n/a] {6.6.7}¹¹
- If deterioration seen, inspect per NFPA 211 (**p.33**) _____ [n/a] {6.6.7.2}
- Type L vents must be L&L & installed AMI _____ [1804.3] {6.7.1.2}
- Type L vent termination min 2 ft. above roof **F30** _____ [1804.2.4] {6.7.1.4}
- Chimney termination min 3 ft. above roof **F30** _____ [1805.1] {6.6.6}
- Vent or chimney termination 2 ft. above any portion of building within 10 ft. **F30** _____ [1804.2.4 & 1805.1] {6.7.1.4}
- Masonry chimneys req cleanout opening _____ [1801.3.3] {6.6.1}
- Masonry chimneys req liner _____ [1805.1] {6.6.8}

Chimney Connectors

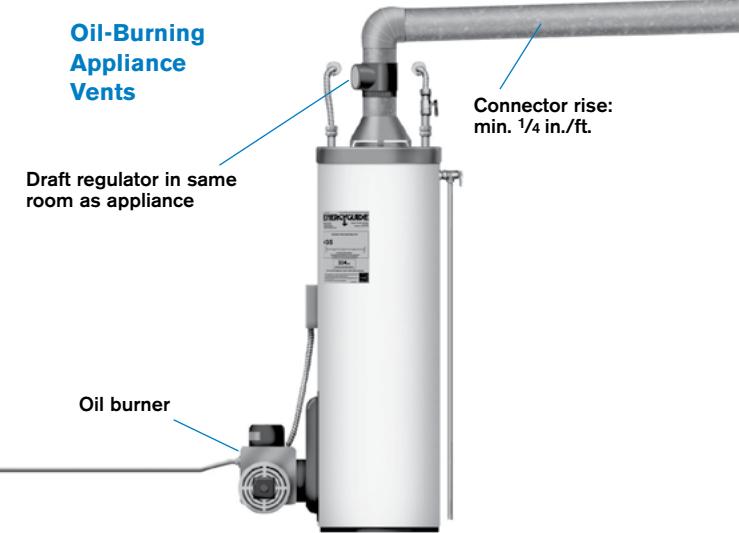

09 IRC NFPA 31

- Connectors as short & straight as practical _____ [1803.3] {6.5.10}
- Min rise $1/4$ in./ft. **F33** _____ [1803.3] {6.5.10}
- Secure support req'd _____ [1803.3] {6.5.13}
- Joints screwed (min 3 screws NFPA 31) _____ [1803.3] {6.5.14}
- Diameter min size of flue collar of appliance _____ [1803.3.3] {6.5.7}
- Horizontal distance max 75% of vertical _____ [1803.3.2] {6.5.1.2}
- Horizontal distance max 10 ft. without draft fan _____ [n/a] {6.5.1.1}
- Draft fans req's burner interlock _____ [n/a] {6.3.2}

FIG. 33

Oil-Burning Appliance Vents

Draft regulator in same room as appliance

OIL TANKS & PIPING

While the IRC & NFPA 31 provide rules for buried tanks, many jurisdictions do not permit them, as the potential for groundwater contamination is present should they develop a leak. Storage tanks may also be under the jurisdiction of the local fire protection district. There are special considerations with tanks in flood-prone areas or those with high seismic risk.

Tanks: General

	09 IRC	NFPA 31
<input type="checkbox"/> Tanks must be L&L	[2201.1]	{7.2.1} ¹²
<input type="checkbox"/> Install above design flood elevation or per NFPA 30	[2201.6]	{7.2.8.1}
<input type="checkbox"/> Restrain against earthquake movement per local codes	[1307.2]	{7.3.8.2}
<input type="checkbox"/> Tanks & supports req solid concrete foundations	[n/a]	{7.3.1} ¹³
<input type="checkbox"/> Design foundation to minimize settling & corrosion	[2201.2]	{7.3.2}
<input type="checkbox"/> Max 660 gal above ground or inside building EXC	[2201.2]	{n/a}
• Systems compliant with NFPA 31	[2201.2X]	{7.2.7.2-5}

Outside Tanks

	09 IRC	NFPA 31
<input type="checkbox"/> Outside tank supports firmly anchored to foundation	[n/a]	{7.3.3}
<input type="checkbox"/> Tanks ≤ 275 gal (660 gal IRC) min 5 ft. from PL	[2201.2.2]	{7.8.2}
<input type="checkbox"/> Tanks > 275 gal & ≤ 660 gal min 10 ft. from PL	[n/a]	{7.8.2}
<input type="checkbox"/> Tanks > 660 gal per NFPA 30	[2201.2X]	{7.8.3}
<input type="checkbox"/> External tanks req corrosion-resistant coating	[2201.2.2]	{7.8.4}

Inside Tanks

	09 IRC	NFPA 31
<input type="checkbox"/> Inside tanks > 60 gal only on lowest floor EXC	[2201.2X]	{7.5.4}
• Spill containment & no floor or open space below	[2201.2X]	{7.5.5}
<input type="checkbox"/> Tanks > 10 gal min 5 ft. from any fire or open flame	[2201.2.1]	{7.5.7}

Abandoned Tanks

	09 IRC	NFPA 31
<input type="checkbox"/> Temporarily unused tanks emptied, cleaned & fill pipe filled with concrete & all other piping capped	[2201.7]	{7.12}
<input type="checkbox"/> Remove per International Fire Code or NFPA 30	[2201.7]	{7.14}
<input type="checkbox"/> Also remove exterior piping of abandoned tanks	[2201.7]	{7.13.1}

Fill & Vent Piping

	09 IRC	NFPA 31
<input type="checkbox"/> Each tank or tank system req's separate fill & vent	F34	[2203.4] {7.5.9}
<input type="checkbox"/> Fill & vent pipes must terminate outside building	F34	[2203.3&5] {8.4.7}
<input type="checkbox"/> Tank fill & vent piping min schedule 40 steel or brass		[2202.1] {8.2.1.1}
<input type="checkbox"/> No cast-iron fittings		[2202.2] {8.3.4}
<input type="checkbox"/> Fill pipe min 1 1/4 in. & pitched toward tank		[manu] {8.5.1}
<input type="checkbox"/> Vent pipe min 1 1/4 in. & pitched toward tank		[2203.4] {8.6.1}
<input type="checkbox"/> Fill piping min 2 ft. from building openings		[2203.3] {8.5.2}
<input type="checkbox"/> Each tank req's fill gauge (only inside tanks IRC)		[2201.5] {7.5.10}
<input type="checkbox"/> Fill gauge may be visual or audible		[n/a] {8.10.3}
<input type="checkbox"/> No glass gauges or gauges subject to breakage		[2201.5] {8.10.4}
<input type="checkbox"/> Vent termination min 2 ft. from building openings		[2203.5] {8.6.2}
<input type="checkbox"/> Vent terminal screened & with weatherproof cap	F34	[2203.5] {8.6.3&4}
<input type="checkbox"/> Vent terminal above snow level & visible from fill		[2203.5] {8.6.2.1&2}

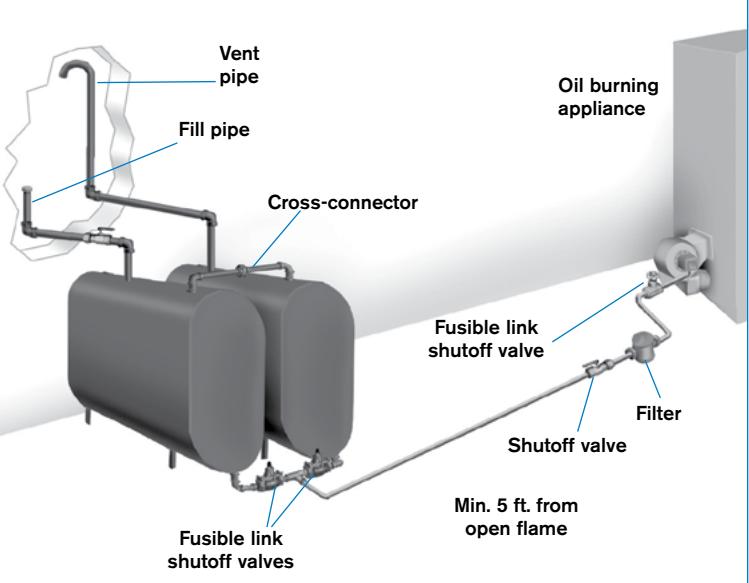

Piping & Tubing to Appliances

	09 IRC	NFPA 31
<input type="checkbox"/> Fuel supply schedule 40 steel or brass or seamless Cu, brass, or steel tubing		[2202.1] {8.2.2.1}
<input type="checkbox"/> Tubing req's corrosion-resistant coating or protective conduit to within 12 in. of tank or appliance		[n/a] {8.2.2.2.1}
<input type="checkbox"/> Min tubing size 3/8 in. outside diameter Type L Cu		[2203.2] {8.7.1}
<input type="checkbox"/> Manual shutoff req'd at tank outlet		[2204.2] {8.7.1}
<input type="checkbox"/> Shutoff req'd at building entrance if tank outdoors		[n/a] {9.2.11.1}
<input type="checkbox"/> Cross-connection of tanks to 660 gal total OK	F34	[2203.6] {8.9.1}
<input type="checkbox"/> Fusible link safety shutoffs req'd within 6 in. of filter on tank side & within 12 in. of inlet connection to burner	F34	[n/a] {8.10.6} ¹⁴

Licensed exclusively to US Inspect - copying or redistribution prohibited

FIG. 34

Indoor Oil Tanks

Compared to other fuels, heating oil has the greatest number of Btus per gallon (approximately 139k). It can be safely stored indoors as it is less readily ignitable than gasoline or propane. It is a commonly used fuel in the Northeast & relatively rare in western states or areas where natural gas is readily available. It displaced coal as the primary fuel source in many areas of the country. Heating oil typically has a red dye added to distinguish it from diesel oil.

PROPANE (LP GAS)

The IRC & UMC defer to NFPA 58, the *Liquefied Petroleum Gas Code*, published by NFPA. LP gas liquefies under moderate pressure & vaporizes upon release of the pressure. Horizontal storage tanks are manufactured to standards from the American Society of Mechanical Engineers (ASME) & portable cylinders are manufactured to U.S. Department of Transportation (DOT) standards. As a liquid or gas, propane is heavier than air & when gas leakage occurs in a pit or basement, an invisible pool of combustible material can accumulate until it rises to the level of an ignition source, such as the pilot or igniter on an appliance. One method of protection against this hazard is an interlock that would shut off the gas flow. Another method is to install a drain from the area containing the equipment & piping, as in F36.

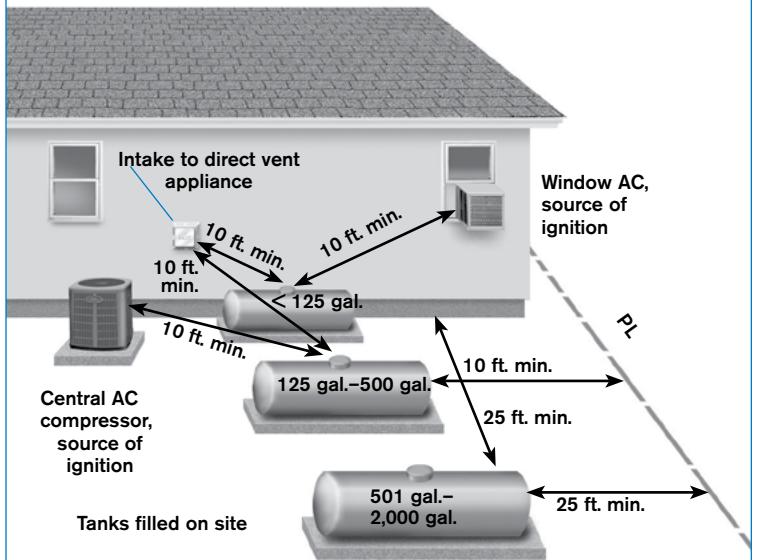

Horizontal ASME Tanks

- Tank clearances F35 _____ [6.3.3&8&9 & Annex I]
- Tank not allowed indoors _____ [6.2.1]
- Protect tanks from damage by vehicles _____ [6.6.1.2]
- Masonry or concrete foundation req'd under tanks _____ [6.6.3.1]
- Supports must be corrosion resistant & noncombustible _____ [6.6.3.5]
- Secure tank against flotation in flood hazard areas _____ [6.6.1.6]
- Secure tanks in seismic areas as approved by local AHJ _____ [5.2.4.3D]
- Min 10 ft. from easily ignitable material (weeds, firewood, dry grass) _____ [6.4.5.2]
- Replace containers with excessive dents or corrosion _____ [5.2.1.4]

NFPA 58

Licensed exclusively to US Inspect - copying or redistribution prohibited
Tank Valves & Regulators

FIG. 35

Propane Tank Clearances**NFPA 58**

- Vapor & liquid shutoff valve req'd _____ [5.7.4.1]
- Shutoff valve req'd to be readily accessible _____ [5.7.8.1G]
- PRV req'd _____ [5.7.4.1 & 5.7.2.5]
- Rain cap req'd over PRV _____ [6.7.2.4]
- No shutoff valve between tank & PRV _____ [6.7.2.8]
- No shutoff valves on outlet of PRV _____ [6.7.2.10]
- First-stage or high-pressure regulator req'd outdoors _____ [6.8.1.4]
- Regulator must be designed to resist elements (freezing) _____ [6.8.1.5]

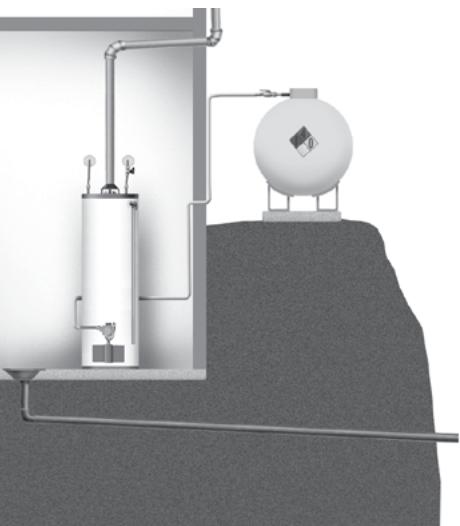

NFPA 58**Piping & Tubing Systems**

- Piping material black, galvanized, brass, PE, or polyamide AMI _____ [5.9.3.1]
- Tubing brass, Cu L or K, CSST PE, or polyamide AMI _____ [5.9.3.2]
- Plastics OK only underground & outdoors _____ [6.9.4.1]
- Min 14AWG tracer wire req'd to be run with plastic pipe _____ [6.9.4.6]
- No cast-iron pipe fittings _____ [5.9.4.1]
- Buried metal pipe min 12 in. cover (18 in. if damage likely) EXC _____ [6.8.3.12]
 - Conduit or shielding OK when 12 in. cover not possible _____ [6.9.3.12]
- Underground metal piping req's corrosion protection _____ [6.9.3.14]
- LP gas piping not OK as grounding electrode _____ [6.9.3.15]
- Grounding & bonding for static electricity protection not req'd _____ [6.22.1.3]
- Dielectric fitting req'd between above- & below-ground pipe _____ [6.9.3.16]¹⁵
- Dielectric fitting to be above ground & outdoors _____ [6.9.3.16]¹⁵

Licensed exclusively to US Inspect - copying or redistribution prohibited

FIG. 36

Propane Appliance in Basement

To prevent accumulation of an explosive concentration of propane from a leak, below-grade pits or basements should have a detector interlocked to the fuel line or a gravity drain to daylight.

FREESTANDING FIREPLACE STOVES (SOLID FUEL)

The IRC (section 1414.1) req's fireplace stoves to be listed, labeled & tested in accord with UL737, which in turn references the current edition of NFPA 211. NFPA 211 also recognizes unlisted appliances & provides specific rules to maintain safe clearances & protection of adjacent combustible material.

Fireplace Stoves & Solid-Fuel Room Heaters

NFPA 211

- Install listed equipment per L&L & AMI _____ [12.1]
- Install unlisted equipment AMI & per NFPA 211 _____ [12.1]
- Fire screen req'd per L&L _____ [12.1]
- Not in alcove or enclosed space < 512 cu. ft. unless so listed _____ [12.2.2]
- Not OK in garage _____ [12.2.4]
- Noncombustible floor material 18 in. beyond stove on all sides EXC _____ [12.5.1.4]
 - L&L floor protection assemblies OK AMI _____ [12.5.1.5]
- List appliance floor protection AMI _____ [12.5.1.1]
- Unlisted appliance floor protection:
 - If legs provide ≥ 6 in. of ventilated clearance under stove, 2 in. thick masonry + metal **F37** _____ [12.5.2.1]
 - If legs provide 2 in. to 6 in. of ventilated clearance, 4 in. thick hollow masonry + metal **F37** _____ [12.5.2.2]
- If legs provide < 2 in. clear, floor req'd to be noncombustible _____ [12.5.2.3]
- Fuel storage (firewood) min 36 in. from appliance _____ [T12.6.1 note a]
- 36 in. side, top & front clearance from appliance to combustibles EXC [12.6.1]
 - Listed appliance clearance to combustibles AMI _____ [12.6.1.1]
 - Lesser clearances OK per **T9, F37,38** _____ [12.6.2.1]

Connectors

NFPA 211

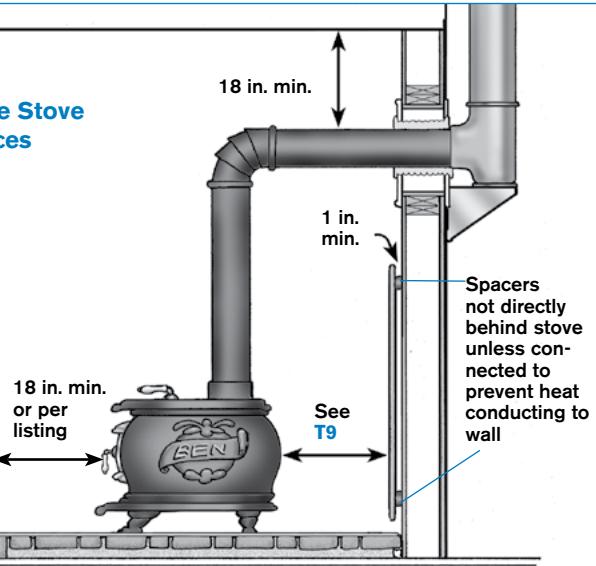

- Must be accessible for inspection, cleaning & replacement _____ [9.7.11]
- Single wall min 18 in. clear to combustibles EXC **F37** _____ [T9.5.1.1]
 - Lesser clearance with approved clearance-reduction system **T9** _____ [9.5.1.2.1]

Connectors (cont.)

- Not to pass through wall EXC _____ [9.7.4]
 • Listed pass-through system _____ [9.7.4]
- System designed per NFPA 211 figure 9.7.5 _____ [9.7.5]
- Maintain min 1/4 in./ft. rise from appliance collar to chimney _____ [9.7.7]

FIG. 37**Fireplace Stove Clearances**

2 in. thick
OK if legs provide
6 in.
space under
stove

Connection to Masonry Fireplace (Stoves & Fireplace Inserts) NFPA 211

- Connector must extend to flue liner—not just to firebox _____ [12.4.5.1]
- If connector enters direct through chimney wall above smoke chamber, noncombustible seal req'd below entry _____ [12.4.5.1]
- No dilution of combustion products in flue with habitable space air _____ [12.4.5.1]
- Flue not less than size of appliance collar _____ [12.4.5.1]
- Flue diameter max 2x appliance collar if chimney walls exposed to exterior below roof _____ [12.4.5.1]
- Flue diameter max 3x appliance collar if no part of chimney walls exposed to exterior below roof _____ [12.4.5.1]
- Installation must allow for chimney inspection & cleaning _____ [12.4.5.1]

RECOMMENDED INSPECTIONS OF EXISTING CHIMNEYS NFPA 211 14.3

Level 1: All readily accessible areas of chimney, structure & flue. To be performed annually, during routine cleaning & when replacing appliances with a similar appliance.

Level 2: Level 1 + video scan of flue. Verify clearances & suitability of flues. To be performed upon resale of property; upon addition or removal of appliances, adding or replacing with dissimilar appliance, or after operating malfunction.

Level 3: Level 1 & 2 + removal of components as necessary to gain access. To be performed when Level 1 or Level 2 cannot identify conditions deemed critical to renewed or continued use; fire or damage investigations.

Licensed exclusively to US Inspect - copying or redistribution prohibited

CLEARANCE REDUCTION SYSTEMS

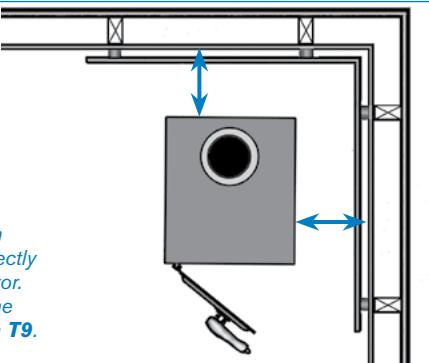

Clearance reduction systems are used with solid-fuel, oil-burning & gas-burning appliances. They provide a practical means of installing appliances in spaces where they otherwise might not fit or would take too much space in a room. They may not be used with appliances in closets (alcoves); those appliances req clearances in accordance with the nameplate label. Tables 9.5.1.2 & 12.6.2.1 in NFPA 211 have the same values as **T9** for fireplace stoves, which otherwise req 36 in. clearance. The UMC uses **T9** as Table 5-3 & in NFPA 54 it is table 10.2.3(b).

General

- Clearance reductions allowed per **T9** _____ [1306.2, 1803.3.4, 2409.2]
- Gas appliance & vent connector reductions per **F39, T9** _____ [2409.2]
- Solid fuel appliances not allowed to be reduced to < 12 in. EXC _____ [1306.2.1]
 - Appliances listed for < 12 in. & installed AMI _____ [1306.2.1]
- No spacers directly behind appliance or connector **F37,38** _____ [F1306.2]
- Spaces noncombustible (stacked washers, conduit, etc.) _____ [F1306.2]
- Ventilated air space min 1 in. & open at edges **F37, 38, T9** _____ [1306.2]
- Air space in corner open top & bottom **F38, T9** _____ [1306.2]
- Air space on flat wall open top & bottom or side & top **F37, T9** _____ [1306.2]

FIG. 38

Clearance Reduction System for Fireplace Stove

The spacers that hold out the clearance reduction system from the wall must not be located directly behind the appliance or connector. The appliance's distance from the wall must be in accordance with **T9**.

TABLE 9

CLEARANCE REDUCTION (in.) [T1306.2] {T5-3}

Unprotected	36	18	12	9	6	36	18	12	9	6
Method ^A	Protected Wall Clearance					Protected Ceiling Clearance				
3½ in. masonry	24	12	9	6	5	n/a	n/a	n/a	n/a	n/a
3½ in. masonry with air space ^B	12	6	6	6	6	n/a	n/a	n/a	n/a	n/a
½ in. insulation board over fiber or mineral wool batts ^c	18	9	6	5	3	24	12	9	6	4
½ in. insulation board with air space ^B	12	6	4	3	3	18	9	6	5	3
24 gage Zi steel with air space ^B	12	6	4	3	2	18	9	6	5	3
1 in. insulating batts between 2 sheets 0.024 Zi steel with air space	12	6	4	3	3	18	9	6	5	3
24 gage Zi steel over reinforced batts with air space ^B	12	6	4	3	3	18	9	6	5	3

A. Clearances are measured in closest stretched-string distance. In no case can a solid-fuel burning appliance clearance be reduced to < 12 in.

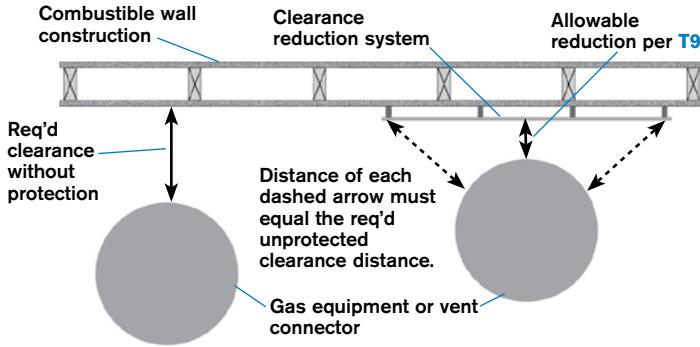

B. Air spaces must be a min. of 1 in. & ventilated by being open at bottom & top edges or sides & top edges. Spacers must be noncombustible & cannot be mounted directly opposite the appliance or connector.

C. Insulation fiber or mineral wool must have thermal conductivity ≤ 1.0 Btu/sq. ft. Mineral wool blankets or board min. density 8 lbs./cu. ft. & min. melting point 1500°F.

FIG. 39

Clearance Reduction for Gas Equipment or Gas Vent Connectors

ELECTRIC HEAT

Electric resistance heating can be in the form of central forced-air furnaces, baseboard heaters, radiant ceiling panels, duct heaters & even exotic systems such as electric heat in ceramic tile bath floors. The wiring for electric heating must be sized to 125% of the load to ensure that it does not also become a heater.

General

- | 09 IRC | 11 NEC |
|---|-----------|
| <input type="checkbox"/> Circuits considered continuous load _____ [3702.10] | {424.3B} |
| <input type="checkbox"/> Circuits for continuous loads sized to 125% of load _____ [3701.2] | {210.20A} |
| <input type="checkbox"/> All electric heating equipment must be L&L _____ [3403.3] | {424.6} |
| <input type="checkbox"/> Factory-applied nameplates must include: _____ [1303.1] | {424.6} |
| • Label with manu name, model & serial no. | |
| • Operating & maintenance instructions or publication no. of manual | |
| • Rating in volts, amperes, or watts, no. of phases if > 1 | |
| • Req'd clearances from combustibles | |

Central Electric Heat

09 IRC 11 NEC

- Disconnect in sight of equipment unless breaker capable of being locked in OFF position _____ [4101.5] {424.19}
- Locking means must remain without lock installed _____ [T4101.5] {424.19}

Baseboard Heaters

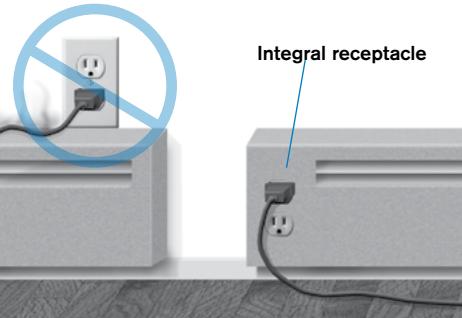

09 IRC 11 NEC

- Must be L&L & installed AMI _____ [3403.3] {424.6}
- Branch circuits for 2 or more units can be 15, 20, 25, or 30 amps _____ [3702.10] {210.3}
- No receptacles above heaters: integral receptacles with heaters can substitute for req'd receptacles in rooms F40 _____ [1405.1] {424.9}

FIG. 40

Electric Baseboard Heaters

Listing instructions prohibit installation of baseboard heaters under receptacles

Integral receptacle

Heating Cables in Concrete or Masonry Floors

11 NEC

- Min 1 in. spacing between cables _____ {424.44B}
- Leads protected where leaving floor _____ {424.44E&F}
- GFCI protection req'd for cables in bathroom floors _____ {424.44B}
- Secure in place while concrete or other finish applied _____ {424.44C}
- Inspection & approval req'd before covering _____ {424.44G}

Licensed exclusively to US Inspect - copying or redistribution prohibited

Electric Radiant Heat Systems

09 IRC 11 NEC

- Install AMI _____ [1406.1] {424.9A1}
- Install panels parallel to framing _____ [1406.3] {424.9B2}
- Fasteners > 1/4 in. from heating element _____ [1406.3] {424.9B3}
- Min 8 in. distance from surface-mounted fixture boxes _____ [n/a] {424.9A3}
- Min 2 in. distance from recessed fixtures & trim _____ [n/a] {424.9A3}
- No field modification of panels unless so listed _____ [1406.3] {424.9B4}
- Wiring above heated ceiling min 2 in. clearance _____ [n/a] {424.94}
- Wiring above heated ceiling considered as 50°C ambient unless over ≥ 2 in. thermal insulation _____ [n/a] {424.94}

Electric Duct Heaters

09 IRC 11 NEC

- Install AMI _____ [1407.1] {424.66}
- If used in system with AC, must be L&L for same _____ [1407.1] {424.62}
- If < 4 ft. from heat pump/air-conditioning, both must be listed for such clearances _____ [1407.3] {424.61}
- Install with manu recommended clearance from Class 1 ducts unless L&L for direct connection _____ [1407.2] {424.66}
- Lockable breaker req'd or disconnect within sight _____ [4101.5] {424.65}
- Each unit req's integral limit controls & manual reset _____ [1407.1] {424.64}
- Must be accessible for servicing _____ [1407.4] {424.66}
- Interlock req'd to prevent heat if fan not operating _____ [1407.5] {424.63}

TABLE 10

DRYER FITTING EQUIVALENT LENGTH [T1502.4.4.1 & T2439.5.5.1]

FIG. 41

Dryer Exhaust

If duct length based on manu instructions, copy must be provided to AHJ & duct must be inspected.

The Consumer Product Safety Commission (CPSC) estimates that up to 16,000 home fires a year originate at clothes dryers. Common causes of these fires are lint buildup from improperly installed or maintained exhaust ducts. Screws should not penetrate to the interior of the duct as they accumulate lint, which leads to blockage.

Dryers with specific manu instructions are allowed longer lengths than otherwise permitted by code.

VENTILATION & EXHAUST SYSTEMS

Building codes tell us when we must provide ventilation for interior spaces & mechanical codes tell us how to provide it. These topics overlap with energy codes & green building standards. The standard recognized in many energy codes is ASHRAE 62.2, Ventilation & Acceptable Indoor Air Quality in Low-Rise Residential Buildings. Check with your local jurisdiction to determine if these standards apply in your area. Whole-house ventilation is intended to dilute the contaminants from materials found in furnishings, furniture & building products. Localized exhaust removes contaminants from specific sources, such as kitchens & baths.

Whole Building Ventilation

- | | |
|---|---------|
| <input type="checkbox"/> Mechanical exhaust, supply, or combination system req'd | [4.1] |

ASHRAE 62.2

TABLE 11 MIN. VENTILATION RATES (CFM) (ASHRAE 62.2 T4.1A)

Floor Area (sq. ft.)	Number of Bedrooms				
	0-1	2-3	4-5	6-7	> 7
< 1,500	30	45	60	75	90
1,501-3,000	45	60	75	90	105
3,001-4,500	60	75	90	105	120
4,501-6,000	75	90	105	120	135
6,001-7,500	90	105	120	135	150
> 7,500	105	120	135	150	165

The requirement can be met from multiple sources, such as 2 or more continuously operating exhaust fans adding up to at least the req'd amount in the table.

Licensed exclusively to US Inspect - **ASHRAE 62.2**

Local Exhaust

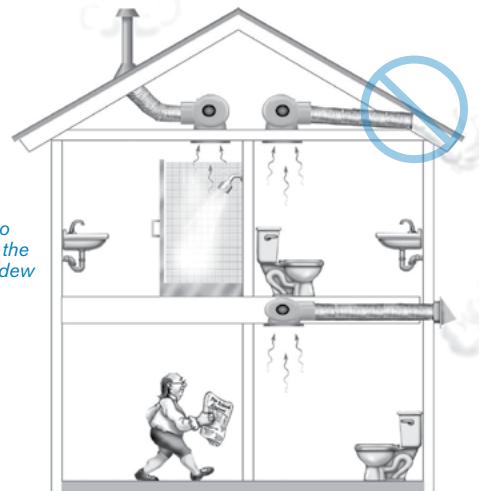

- Mechanical exhaust req'd each kitchen _____ [5.1]
- Kitchen exhaust min 100cfm intermittent or 5ACH continuous _____ [T5.1 & T5.2]
- Vented range hood req'd if 100 cfm is < 5 kitchen ACH _____ [T5.1]
- Bathroom 50cfm intermittent or 20cfm continuous _____ [T5.1 & T5.2]
- Controls may be humidistat, timer, or occupancy sensor provided
that occupant has ability to override control _____ [5.2.1]

Additional Air Quality Requirements**ASHRAE 62.2**

- Clothes dryers req exterior exhaust except condensing dryers _____ [6.3]
- Air inlets min 10 ft. from contaminants such as plumbing vents _____ [6.8]
- Exhaust ventilation may not deplete combustion air to appliances within
pressure boundary (sum of 2 largest exhaust max 15cfm/100 sq. ft.) _____ [6.4]
- Door from attached garage to house weatherstripped _____ [6.5.1]
- Duct leakage outside pressure boundary max 6% _____ [6.5.2]
- Central furnace or AC system filter min efficiency reporting value
MERV 6 _____ [6.7]
- Habitable spaces req ventilation openings \geq 4% of floor area _____ [6.6.1]
- Utility rooms req ventilation openings \geq 4% of floor area EXC _____ [6.6.2]
 - Utility rooms with dryer exhaust duct _____ [6.6X]

Bathroom Exhaust & Ventilation**09 IRC ASHRAE**

- Ventilation from 1.5 sq. ft. window opening OK or _____ {Ø}
 - Mechanical ventilation 50cfm intermittent or 20cfm continuous
direct to exterior (req'd in ASHRAE 62.2) **F43** _____ [303.X] {5.1}
- Air may not be exhausted into attic _____ [1501.1] {n/a}
- Toilet rooms req vent openings \geq 4% of floor area EXC _____ [n/a] {6.6.2}
 - Toilet compartments within bathrooms _____ [n/a] {6.6X}
- Air exhaust & intake openings req screens _____ [303.5] {n/a}

Paddle Fan Support**KITCHENS****Freestanding Ranges****09 IRC 09 UMC**

- Must be listed as household type—not commercial _____ [2447.3] {n/a}
- Vertical clearance to combustibles min 30 in. EXC _____ [1901.1] {916.1B}
 - Lesser clearances AMI _____ [1901.1] {916.1B}
 - 24 in. OK with metal hood or metal over millboard _____ [n/a] {916.1B}
- Side clearance to combustibles AMI EXC _____ [1901.2] {916.1A}
 - 6 in. min sides & rear for unlisted appliances _____ [Ø] {916.1A}

Built-in Ranges**09 IRC 09 UMC**

- Install AMI _____ [1901.2 & 2447.1] {916.2A&C}
- Vertical clearance to combustibles min 30 in. EXC F45 _____ [1901.1] {916.2B}
 - Lesser clearances AMI F45 _____ [1901.1] {916.2B}
 - 24 in. OK with metal hood or metal over millboard _____ [n/a] {916.2B}
- Must be level _____ [n/a] {916.2D}

Hood for Open-Top Broilers**09 IRC 09 UMC**

- Hood req'd & must extend as wide as broiler unit _____ [1505.1] {920.3}
- Min 1/4 in. clearance to combustibles _____ [1505.1] {920.3}
- Min 24 in. from cooking surface to combustible materials [1505.1] {920.3}
- Must be ducted to outdoors & have backdraft damper _____ [1505.1] {504.1}

Range Hoods**09 IRC 09 UMC**

- Must go outdoors (min 3 ft. from openings UMC) EXC _____ [1503.1] {504.5}
 - Ductless (recirculating) range hoods OK _____ [1503.1X] {303.1}
- Exterior openings screened with 1/4 in. to 1/2 in. mesh _____ [1503.1] {n/a}
- Min 100 cfm intermittent or 25 cfm continuous _____ [1503.3] {n/a}
- PVC OK for downdraft duct under slab _____ [1503.2X] {504.2X}

FIG. 45

Range Clearances

Lesser clearances allowed for listed appliances per terms of listing.

**KITCHENS**

Licensed exclusively to US Inspect - copying or redistribution prohibited

GLOSSARY

A

ABS (acrylonitrile-butadiene-styrene): A plastic pipe that is usually black and used for DWV. It can also be used for building water supply and for vent piping of high-efficiency condensing appliances.

Accessible: Capable of being exposed without damage to the building or component structure or finishes, and that may req removal of access doors or fasteners req tools.

AHJ (Authority Having Jurisdiction): An organization responsible for enforcing the code, typically the building department & its authorized representatives.

Airbreak: A physical separation in which a discharge pipe from a fixture, appliance, or device drains indirectly into a receptor & enters below the flood level rim of a receptor, such as a clothes washer standpipe.

Air conditioning: The process of heating, cooling, humidifying, dehumidifying, filtering, or otherwise treating air in a building. Most nontrade persons relate this term to cooling only.

Air handler: A blower or fan enclosed in a metal box used for the purpose of distributing supply air to a room, space, or area.

Alcove: A room or space such as a closet that is not large in relationship to the appliances within it. It would be less than 16 times the volume of a boiler or 12 times the volume of a furnace. For measurement purposes, only the portion of the room up to 8 ft. above the floor counts in determining volume. *Also see "Room large in comparison to size of equipment."*

Approved: Accepted by the Authority Having Jurisdiction (AHJ). UL & other testing laboratories do not approve materials; they test products & determine their conformity to published standards. Only the AHJ can approve them.

B

Backflow: A flow of water or other liquids, mixtures, or substances into the distributing pipes of a potable supply of water from any source other than its intended source.

Bathroom: In ASHRAE, a bathroom is a room containing a tub, shower, spa, or other source of moisture. A half bath contains only a water closet & lavatory & is not considered a bathroom. In the NEC, a bathroom is a room containing a basin & another plumbing fixture.

Btu (British thermal unit): The quantity of heat necessary to raise the temperature of 1 lb. of water 1°F.

Building thermal envelope: The basement walls, exterior walls, floor, roof & any other building element that encloses conditioned spaces.

C

Central-fan-integrated supply system: A method of supplying whole-house ventilation through a makeup air duct connected to the supply ducts of a forced-air system & a timer on the furnace fan control.

Check valve: A device used to prevent the flow of liquids in a direction not intended in the design of the system. Check valves are not backflow preventers. They are often used in solar systems.

Chimney: A primarily vertical structure containing one or more flues, for the purpose of carrying gaseous products of combustion & air from an appliance to the outside atmosphere. Factory-built chimneys must be listed & labeled. Masonry chimneys are field constructed of solid masonry units, bricks, stones, or concrete.

Licensed exclusively to US Inspect - copying or redistribution prohibited

Chimney connector: A pipe connecting a fuel-burning appliance to a chimney flue.

Closet: See "Alcove." [F32](#)

Combustible material: Any material not defined as noncombustible. The extent of combustibility of surface materials is measured in flame spread index & smoke-developed index. Many HVAC components req specified clearances from combustible material, including the paper facing of gypsum board.

Combustion air: Air req'd for combustion of a fuel. It includes air that is burned with the fuel, air for dilution of the flue gases and that is introduced into draft hoods, and ventilation air that cools appliances.

Common vent: A pipe venting two trap arms on the same branch, either back to back or one above another.

Concealed: Not exposed to view without removal of building surfaces or finishes.

Confined space: A room or space having a volume less than 50 cu. ft. for each 1,000Btu input rating of all fuel-burning appliances in the room or space.

CPVC (chlorinated polyvinyl chloride): Plastic pipe designed for hot & cold water. Water distribution pipe is typically cream-colored, and orange CPVC is used for automatic fire sprinkler piping.

D

Decorative appliance for installation in fireplaces: An assembly with artificial logs & with gas burners to simulate a solid-fuel fire, installed inside a fireplace otherwise capable of burning solid fuel. They can be either manually or automatically operated. If automatic, they must include a flame safeguard device.

Decorative shroud: A partial enclosure for aesthetic purposes that surrounds or conceals the termination of a chimney or vent. Decorative shrouds must be specifically listed for the chimney or vent assembly & are often installed incorrectly.

Dilution air: Air that combines with flue gases at the draft hood of an appliance. See "Combustion air."

Direct-vent appliances: Appliances that are constructed & installed so that all air for combustion is derived from the outside atmosphere & all flue gases are discharged directly to the outside atmosphere, usually by a coaxial flue pipe inside the combustion air pipe.

Draft: The flow of gases or air through a chimney or flue caused by pressure differences. An induced draft appliance has a fan to overcome the resistance of the combustion chamber while still delivering flue gas to the vent at nonpositive pressure relative to the atmosphere. A forced draft appliance delivers flue gas under positive pressure. Natural draft is caused by the height of the chimney & the difference in temperature of hot gases & outside atmosphere.

Draft hood: A nonadjustable device integral to an appliance or made part of the appliance connector. It provides for the escape of flue gases from the appliance in the event of insufficient draft, backdraft, or stoppage. A draft diverter (typical on WH) prevents backdraft from entering the appliance & neutralizes the stack effect on the operation of the appliance.

Draft regulator: A device that functions to maintain a desired draft in the appliance by automatically reducing the draft to the desired value. These are usually adjustable, such as the barometric damper on an oil-burning appliance flue. A double-acting barometric draft regulator is free to move in either direction & protect against both excessive draft (that could allow the flame to lift) & backdraft.

Duct: A continuous passageway for the transmission of air (usually forced) made of factory-built components.

E

Energy-recovery ventilator (ERV): Same as heat-recovery ventilator, with a heat exchanger core that removes humidity. ERVs req a drain to remove water that condenses in them.

Licensed exclusively to US Inspect - copying or redistribution prohibited

Evaporative cooler: A device used for reducing the sensible heat of air for cooling by the process of evaporation of water into an airstream. Also known as a "swamp cooler." Evaporative coolers are used in hot, dry climates & for makeup air in commercial kitchens.

F

Factory-built fireplace: A fireplace composed of listed factory-built components assembled in accordance with the terms of the listing to form the completed fireplace. The appliance must be suitable for solid fuel & be equipped with a listed & properly installed chimney.

Fan-assisted appliance: An appliance equipped with an integral mechanical means to either draw or force products of combustion through the combustion chamber &/or heat exchanger.

Fireblock: Building materials installed to resist the free passage of flame to other areas through small concealed spaces of the building.

Fireplace stove: A freestanding solid-fuel burning device designed to be operated with the firebox door either open or closed.

Firestop: Until the early 1990s, this term was used for what today is called fireblocking. A penetration firestop assembly is a group of materials installed to resist free passage of flame through an assembly, typically around a duct, vent, or chimney passing through a rated ceiling, floor, or wall.

Flame safeguard: A device that will automatically shut off the fuel supply to a main burner or group of burners when the means of ignition of those burners becomes disabled & when flame failure occurs.

Flue: A passageway intended to carry hot gases through a chimney. The term is also used as a substitute for "vent."

Flue collar: The outlet of an appliance designed for the attachment of a draft hood, vent connector, or venting system.

Flue gases: Products of combustion plus excess air in appliance flues or heat exchangers.

copying or redistribution prohibited

Forced draft: A vent system using a fan or other mechanical means to expel flue gases under positive static vent pressure.

Furnace: A device that is completely self-contained & designed to supply heated air to spaces remote from or adjacent to the furnace location. A central furnace uses ducts to supply heat to spaces.

G

Gas connector: Tubing or piping that connects the gas supply piping to the appliance.

H

Habitable room: A room used for living, sleeping, eating, or cooking. Bathrooms, closets, halls, storage spaces & laundry rooms are not considered habitable rooms.

Hangers: See "Supports."

Hearth: The floor area with the fire chamber of a fireplace or fireplace stove.

Hearth extension: The surfacing applied to the floor area in front of & to the sides of the hearth opening of a fireplace or fireplace stove.

Heat pump: A system that uses the change of state of a refrigerant to extract heat from one substance & transfer it to another area of the same or a different substance. Heat pumps can provide both heating & cooling.

Heat-recovery ventilator (HRV): A combination ventilation system that replaces indoor air with outdoor air that passes through a heat exchanger. The heat exchanger tempers the outdoor air to minimize energy losses. HRVs that also remove humidity from the indoor air are referred to as energy-recovery ventilators.

Horizontal: Any pipe or vent that is less than 45° from horizontal.

H.S.P.F. (Heating seasonal-performance factor): The measure of a system's efficiency in heating mode. The higher the number, the more efficient the system.

Licensed exclusively to US Inspect - copying or redistribution prohibited

Welded joint or seam: Joint or seam obtained by the joining of metal parts in the plastic molten state.

I

In sight: See "Within sight."

Indirect-fired WH: A water heater with a storage tank equipped with a heat exchanger used to transfer heat from an external source to heat potable water. The storage tank could derive its heat source from an external source, such as solar or a boiler, or an internal source.

Induced draft appliance: An appliance that utilizes a fan to overcome resistance of a heat exchanger & to assist in the delivery of flue gases to the appliance outlet (flue collar). Induced draft appliances typically deliver the flue gases to the flue collar at non-positive pressure due to the temperature of those gases relative to outside atmosphere. See "Vented gas appliance categories."

Induced draft burner: A burner that depends upon a draft that is induced by a fan that is integral to the appliance & is downstream from the burner.

J

Joint: Connection between two pipes:

Brazed joint: Joint obtained by joining metal parts with alloys that melt at temperatures $> 840^{\circ}\text{F}$ (449°C), but lower than the melting temperature of the parts to be joined.

Expansion joint: Loop, return bend, or return offset that accommodates pipe expansion & contraction.

Flexible joint: Joint that allows movement of one pipe without deflecting the other pipe.

Mechanical joint: Joint that uses compression to seal the joint.

Slip joint: Joint that incorporates a washer or special packing material to create a seal.

Soldered joint: Joint obtained by joining of metal parts with metallic mixtures or alloys that melt at a temperature $< 800^{\circ}\text{F}$ (427°C) & $> 300^{\circ}\text{F}$ (149°C).

L

Label: A marking applied on a product that identifies the manu, the function or designation of the product, and the agency that has evaluated a sample of that product.

Labeled: Equipment, materials, or products affixed with a label or other identifying mark to attest that the product complies with identified standards or has been found suitable for a specific purpose. See "Listed."

Liquefied petroleum (LP) gas: LP or propane gas is composed primarily of propane, propylene, butanes, or butylenes or mixtures thereof that are gaseous under normal atmospheric conditions but capable of being liquefied under moderate pressure at normal temperatures. LP gas is typically stored in tanks on site. Unlike natural gas (CH_4), LP gas (C_3H_8) is heavier than air.

Listed: Equipment or materials on a list published by an approved organization that is concerned with product evaluation and that maintains periodic inspection of production of listed equipment or materials. The listing will state that the product meets specified standards or has been found suitable for a specific purpose.

Log lighter, gas-fired: A manually operated solid-fuel ignition device for installation in a vented solid-fuel burning fireplace. These devices are intended to help initiate a fire in a fireplace, as compared to a decorative appliance for installation in a fireplace.

Low-pressure hot-water heating boiler: A boiler furnishing hot water at pressures not exceeding 160 psi or temperatures not exceeding 250°F .

Low-pressure steam-heating boiler: A steam boiler that operates at pressures not exceeding 15 psi.

Luminaire: A complete lighting fixture including the lamp(s), mounting assembly & cover.

Licensed exclusively to US Inspect - **copying or redistribution prohibited**

M

Makeup air: Air provided to replace air being exhausted.

N

Nationally Recognized Testing Laboratory (NRTL): A testing facility recognized by OSHA as qualified to provide testing & certification of products & services. Examples of NRTLs are CSA, NDF & UL.

Natural-draft burner: A burner in which proper combustion depends on establishing a draft of flue gases that will rise by the pressure difference between the flue gases & outside atmosphere.

Noncombustible material: Material that passes a test procedure as set forth in ASTM E136 for defining noncombustibility of materials. This includes materials that will not ignite & burn when subjected to fire, or material having a structural base of noncombustible material with a surfacing material not > 1/8 in. thick & a flame-spread index not higher than 50. This does not apply to surface-finish materials, the entire material of which must be noncombustible from the standpoint of clearances to heating appliances.

O

Offset: A combination of elbows or bends in a line of piping that brings a section of pipe or a vent out of line, but into a line parallel with the other section.

Ordinary tightness: Buildings of ordinary tightness are those that do not meet the standards for "unusually tight construction."

P

PEX tubing: Water-supply or hydronic heat tubing made of cross-linked polyethylene. PEX-AL-PEX has a layer of aluminum sandwiched between layers of PEX.

Plenum: A chamber, other than the occupied space being conditioned, that forms part of the air circulation system.

Power vent: See "Forced draft."

Pressure boundary: The boundary separating indoor from outdoor air. A ventilated crawl space or attic would be outside the pressure boundary.

Pressure-relief valve (PRV): A device designed to protect against high pressure & to function as a relief mechanism.

R

Readily accessible: Access that does not req removing a panel or door. For electrical equipment, this also means not having to resort to use of a ladder.

Room heater, circulating: A room heater with an outer jacket surrounding the heat exchanger & with openings at the top & bottom designed to circulate air between the heat exchanger & outer jacket.

Room heater (liquid or gas fuel): A room heater installed in the space to be heated & not connected to duct.

Room heater, radiant: A room heater designed to transfer heat primarily by direct radiation.

Room heater (solid fuel): A solid-fuel burning appliance designed to be operated with the fire chamber door closed. See "Fireplace stove."

Room large in comparison to size of equipment: A room having at least 12 times the volume of a furnace or other air-handling device, or 16 times the volume of a boiler. When the ceiling is greater than 8 ft., the volume is calculated based on an 8 ft. height. See "Alcove."

S

Slope: Fall or pitch along a line of a pipe or vent.

Supports: Devices used to support or secure pipes, fixtures, or equipment.

Licensed exclusively to US Inspect - copying or redistribution prohibited

T

Ton (cooling): The amount of heat energy req'd to melt 1 ton of ice (288,000 Btus). Air-conditioners & heat pumps are typically sized in terms of tonnage, based on melting 1 ton of ice in 1 day. Therefore 1 ton of AC = 288,000Btus/24hr. = 12,000 Btus. The tonnage of a unit is usually encoded in the model number as a multiplier of 12, i.e., the number 36 would equal a 3-ton unit.

U

Unconfined space: A room or space having at least 50 cu. ft. for each 1,000 Btu of the fuel-burning appliances contained in the room or space.

Unlisted: An appliance not shown to comply with nationally recognized standards by an approved testing agency. An unlisted appliance might still have nameplate instructions. The IRC does not accept unlisted appliances. The UMC leaves their acceptance to the AHJ.

Unusually tight construction: Construction with walls & ceilings having a vapor retarder of 1 perm or less with sealed or gasketed openings, weatherstripping on openable windows & doors, and caulking or sealant at joints. Buildings of unusually tight construction are req'd by many energy codes & have a targeted air infiltration rate < 0.35ACH.

V

Vent (fuel-burning appliances): A passageway for conveying flue gases from an appliance to the outside atmosphere.

Vent, Type B: A vent listed & labeled for use with appliances with draft hoods & other Category I appliances

Vent, Type BW: A vent listed & labeled for use with wall furnaces.

copying or redistribution prohibited

Vent, Type L: A vent listed & labeled for appliances requiring either type L (oil-fired appliance) vents or Type B vents.

Vent connector: A device that connects an appliance to a vent.

Vented decorative gas appliance: A vented appliance that does not provide heat & whose only function is the aesthetic effect of the gas flames.

Vented gas appliance categories:

Category I: An appliance that operates with nonpositive vent static pressure & with a gas vent temperature that avoids excessive condensate production in the vent.

Category II: An appliance that operates with nonpositive vent static pressure & a vent gas temperature that is capable of causing excessive condensate production in the vent.

Category III: An appliance that operates with a positive vent static pressure & with a vent gas temperature that avoids excessive condensate production in the vent.

Category IV: An appliance that operates with a positive vent static pressure & with a vent gas temperature that is capable of causing excessive condensate production in the vent.

Vertical: Any pipe or vent that is 45° or more from horizontal.

W

Within sight: Visible, unobstructed & not more than 50 ft. away.

Wood stove: See "Fireplace stove" or "Room heater (solid fuel)."

Licensed exclusively to US Inspect - copying or redistribution prohibited

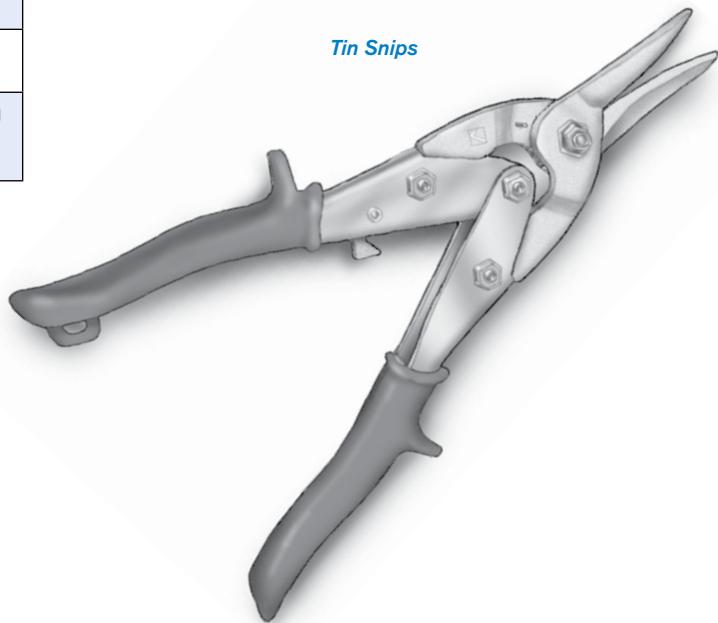

TABLE 12**SIGNIFICANT CODE CHANGES – 2009 IRC, UPC & UMC; 2011 NFPA 31 & NFPA 58**

No.	Page	Code	Description	No.	Page	Code	Description
1	7, 14	2006 UMC 931.3X	Rule allowing furnace to be service from a ladder and placed at edge of attic access opening removed in 2009 UMC; platform now req'd.	10	24	IRC 2427.5.5.1 & UMC 802.5.4.2	Prior code editions had no exception allowing unlined masonry chimneys for gas-burning appliances. They are now acceptable for replacement appliances of same size & characteristics provided chimney passes an NFPA 211 inspection.
2	8	IRC 1403.2	Raised pad for heat pumps still req'd in IRC 1403.2. A broader section, 1308.3, deleted in 2009 IRC. It req'd outdoor AC equipment to be raised at least 3 in. above finished grade.	11	28	NFPA 31 6.6.7	Requirement added that installer verify that chimney is proper size for connected appliances.
3	8	IRC 1411.3.1	Option added for pan with interlocked detector & fitting to allow the pan to drain.	12	29	NFPA 31 7.2.1	Storage tanks must now be listed to one of standards recognized in NFPA 31.
4	10	UMC 311.3&4	2006 UMC did not regulate these return air sources.	13	29	NFPA 31 7.3.1	In 2005 NFPA 31, tanks could be supported on ground or on foundations of concrete, steel, masonry, or pilings.
5	14	IRC 2408.4 & UMC 904.3.1	Gas appliances supported on grade req a slab or equivalent extending at least 3 in. above grade. In UMC, this section applies only for under-floor appliances.	14	29	NFPA 31 8.10.6	2011 edition specifies locations of thermally operated safety shutoff valves.
6	14	UMC 904.3.1.2	UMC now req's 6 in. clearance for suspended under-floor appliances.	15	31	NFPA 58 6.9.3.16	New requirement for dielectric fitting to electrically isolate above ground & below-ground portions of propane piping. Note that while propane piping is not req'd by NFPA 58 to be electrically bonded, NEC does req bonding of any interior piping system capable of becoming energized.
7	15	IRC 2427.8 & UMC 802.8.4	Condensate drain fittings from Category IV appliances to be in accordance with manu instructions. These include a requirement for primer.	16	36	IRC 1502.4.2 & 2439.5.2	New requirement that dryer exhaust ducts be supported & secured at 4 ft. intervals.
8	22	IRC 2427.4.1.1 & UMC 802.4.3	New specification that primers used with plastic vent piping be a contrasting color. Appliance manu instructions also apply to fittings.	17	36	IRC 1502.4.1	New requirement that electric dryer exhaust ducts be min 4 in. diameter.
9	22	UMC 802.7.4.1	UMC no longer allows single-wall gas vents in dwellings. Single-wall connectors still allowed.

TABLE 45
**SIGNIFICANT CODE CHANGES –
2009 IRC, UPC & UMC; 2011 NFPA 31 &
NFPA 58 (cont.)**

No.	Page	Code	Description
18	36	IRC 1502.4.4 & 2439.5.5.1	New rules provide tables for equivalent length of fittings & allow for concealed duct runs of any length allowed by manu.
19	36	IRC 1502.5 & 2439.5.3	Protective shield plates req'd when duct is less than 1 1/4 in. from face of framing.
20	36	IRC 1502.4.5 & 2439.5.6	When duct concealed within framing, label or tag stating equivalent duct length req'd within 6 ft. of duct connection.

Tin Snips

Licensed exclusively to US Inspect - copying or redistribution prohibited

In colonial America, most homes were warmed by building a fire in a fireplace. This method resulted in sending most of the heat up the chimney, using a lot of wood and causing many house fires. In 1742, Ben Franklin invented an iron furnace stove, equipped with loose fitting iron plates through which air circulated & warmed before passing into the room. It warmed homes more efficiently, less dangerously & with less wood—resulting in less air pollution. He named this furnace stove the "Pennsylvania Fireplace," although today it is known as the "Franklin Stove."
